# Chapter 1

## Main Page

### 1.1 Introduction

#### 1.1.1 Hipster

OOLua is cross platform, test driven, dependancy free Open Source library which uses C++03 template meta-programming and pre-processor magic to generate non intrusive proxies that provide a fast bridge for the interaction of C++ classes with Lua; in addition it also provides a thin abstraction layer for interfacing with the Lua stack. It supports multiple inheritance C++ classes without using C++ RTTI and does not use exceptions by default although they are easily enabled.

#### 1.1.2 Normal

OOLua is a library which makes it easy to use C++ classes in Lua and also operating on the stack using a typed interface for common operations.

This is not a fully original work, instead it builds on ideas from binding classes using [Lunar](#) and [Lua Technical Note 5](#).

### 1.2 Lua compatibility

This version of the library is compatible with the following Lua implementations

- Rio Lua 5.1 and 5.2 <http://www.lua.org>
- LuaJIT 1.1.8 and 2.0 <http://www.luajit.org/>

### 1.3 Links

## Chapter 2

# Building

OOLua source code can be dropped into the path for a project and used straight away or it can be compiled as a static library.

### 2.1 Makefiles and IDE projects

OOLua does not provide solution files instead it provides Premake4 [\[1\]](#) scripts. Premake is a simple [\[2\]](#) to use IDE project or makefile generator and can be used to help create a static library or to run [Library Tests](#)

#### 2.1.1 Premake format

premake4 [make or IDE] [target operating system]

##### 2.1.1.1 Makefile

```
premake4 gmake []
```

- macosx
- linux

##### 2.1.1.2 Xcode

```
premake4 xcode[] macosx
```

- 3
- 4

##### Note

macosx is required

##### 2.1.1.3 Visual Studio

```
premake4 vs[] windows
```

- 2005
- 2008
- 2010

**Note**

windows is required

**2.1.1.4 CodeBlocks**

```
premake4 codeblocks []
```

- windows
- linux
- macosx

**2.2 Library limits**

The "oolua\_generate" Lua module provides information about the default limits and allows generation of boilerplate code using user defined limits or regeneration with default values, the details of these being :

```
return
{
  lua_params =
  {
    desc = 'Maximum amount of parameters for a call to a Lua function'
    , value=10
  }
  , cpp_params =
  {
    desc = 'Maximum number of parameters a C++ function can have'
    , value=8
  }
  , constructor_params =
  {
    desc = 'Maximum amount of parameters for a constructor of a proxied type'
    , value=5
  }
  , class_functions =
  {
    desc = 'Maximum amount of class functions that can be registered for each proxied type'
    , value=15
  }
}
```

The most common change to these options is the number of functions which can be registered for a proxy class, this limit applies individually to constant and none constant functions, base class methods that are registered in a base class do not decrease the count for a derived class.

Using the Lua interpreter to regenerate the OOLua files increasing this option whilst using default values for the remaining options:

```
lua -e "require'build_scripts.oolua_generate'.gen({class_functions=30},'include/')"
```

For convenience you do not need a version of Lua installed on a machine to run this module, Premake the project file generator used in OOLua already contains a copy of Lua 5.1 (it has some modifications to the core libraries). To generate the files with the same options as above :

```
premake4 --class_functions=30 oolua-gen
```

The module returns a table with the following functions

```
return { gen = gen, defaults=defaults, default_details=default_details }
```

## 2.3 Library Config

See Also

[Library Configuration](#)

## 2.4 Build Scripts

```
[make or IDE]_build.[sh or bat]
```

When these build scripts are run from the build\_scripts directory they create a "../local\_install" directory into which newly compiled debug and release static libraries will be place along with the library headers in a sub directory "oolua".

## 2.5 Test Unit scripts

```
[make or IDE]_tests.[sh or bat]
```

The scripts test the library [using exceptions](#) and [error return values](#) in both debug and release configurations. When run from the build\_scripts directory these will produce compiler and test unit output saved to disk in the directory "../build\_logs", if an error occurs during a test then a message to stdout will inform of where to locate the full error message and compile log. These test scripts clean up any other files produced during their running.

[2] Premake quick start <http://industriousone.com/premake-quick-start>

# Chapter 3

## Usage

Most if not all of the code snippets shown in this document are working pieces of code taken directly from the [unit test files](#), as such the code is always correct although it may at times not marry up to the text which surrounds it in this documentation. If you should see such a thing please report it on the [issue tracker](#).

- [First look](#)
- [Lua Types in OOLua](#)
- [Proxy](#)

### 3.1 First look

#### 3.1.1 Hello Moon

```
void say(char const* input)
{
    printf("%s from a standalone function\n", input);
}

OOLUA_CFUNC(say, l_say)

void hello_minimalist_function()
{
    using namespace OOLUA; //NOLINT(build/namespaces)
    Script vm;
    set_global(vm, "say", l_say);
    run_chunk(vm, "say('Hello Lua')");
}
```

#### 3.1.2 Conventions

- [DSL](#) macros are upper case and prefixed with OOLUA\_
- [Minimalist](#) DSL macro names are smaller than [Expressive](#)
- Public API functions and types are directly in the [OOLUA](#) namespace
- Public API function names are lower case with words separated by underscores

#### 3.1.3 lua\_State and Script

OOLua is purposely designed not to be dependent on the [Script](#) class and therefore passes around it's dependency of a [lua\\_State](#) instance. The Script class is only a helper and anything you can do with it can be accomplished either via using a [Lua\\_function](#) struct, calling [OOLUA](#) namespaced functions or using the Lua C API.

Script provides the following :

- Scopes a [lua\\_State](#) pointer
- Provides access to the [lua\\_State](#) pointer via a cast operator and [function](#)
- Provides methods to [register](#) types
- Binds a [Lua\\_function](#) instance to [call](#) functions
- Has member functions for a little state management
- [Sets up](#) the state to work with OOLua

#### Note

This class is not copy constructible or assignable. To accomplish this a counted reference to the [lua\\_State](#) would need to be maintained.

If you do not want to or can not use this class please see [setup\\_user\\_lua\\_state](#)

### 3.1.4 OOLua and the Lua stack

The Lua C API does not force you to treat the stack as such a data structure, with operations on just one end, instead for convenience it uses indices to identify stack slots for a procedure. Given that Lua is a C library without C++'s name mangling and overloading, it also provides a function per type for pushing to the stack.

OOLua is a C++ library which tries to enforce a clean stack after operations, it therefore provides a simpler interface to the Lua stack which consists of two functions :

- [push](#) Pushes an instance to top of the Lua stack.
- [pull](#) Pulls the top element off the stack and pops it.

Most usage of OOLua will only require these functions to interact with the stack, although you are free to mix Lua C API calls if you take into account [pull](#) removes the top of the stack when it is valid.

## 3.2 Lua Types in OOLua

OOLua has three types to help interact with Lua types

### 3.2.1 Lua\_ref

The [Lua\\_ref](#) templated class stores a reference using Lua's reference system [luaL\\_ref](#) and [luaL\\_unref](#), along with a [lua\\_State](#). The reason this class stores the [lua\\_State](#) is to make it difficult to use the reference with another universe. A reference from the same Lua universe, even if it is from a different [lua\\_State](#), is valid to be used in the universe.

The class takes ownership of any reference passed either to the [two argument constructor](#) or the [set\\_ref](#) function. On going out of scope a [valid](#) reference is guaranteed to be released, you may also force a release by passing an instance to [swap](#) for which [valid](#) returns false.

There are two special values for the reference which Lua provides, both of which OOLua will treat as an invalid reference:

- [LUA\\_REFNIL](#) [luaL\\_ref](#) return value to indicate it encountered a nil object at the location the ref was asked for
- [LUA\\_NOREF](#) guaranteed to be different from any reference return by [luaL\\_ref](#)

## Template Parameters

| <i>ID</i> | Lua type as returned by lua_type |
|-----------|----------------------------------|
|-----------|----------------------------------|

## Note

- Universe: A call to `luaL_newstate` or `lua_newstate` creates a Lua universe and a universe is completely independent of any other universe. `lua_newthread` and `coroutine.create`, create a [lua\\_State](#) in an already existing universe.

Term first heard in a Lua mailing list post by Mark Hamburg.

For your convenience there are two predefined typedefs:

- [OOLUA::Lua\\_func\\_ref](#)

```
void pullLuaFunction_luaFunctionOnStack_functionIsValid()
{
    lua_pushcclosure(*m_lua, lua_gettop, 0);
    OOLUA::Lua_func_ref lua_func;
    OOLUA::pull(*m_lua, lua_func);
    CPPUNIT_ASSERT_EQUAL(true, lua_func.valid());
}
```

- [OOLUA::Lua\\_table\\_ref](#)

```
void pullTableRef_validTableOnStack_tableIsValid()
{
    lua_createtable(*m_lua, 0, 0);
    OOLUA::Lua_table_ref table;
    OOLUA::pull(*m_lua, table);
    CPPUNIT_ASSERT_EQUAL(true, table.valid());
}
```

### 3.2.2 Lua\_function

[Lua\\_function](#) is a [lua\\_State](#) function caller object, the state in which it calls a function is specified in either the [constructor](#) or via [bind\\_script](#). This object provides function call operator overloads up to "[lua\\_params](#)" count + 1 parameters, the first of which being the function which is to be called and it's type maybe one of:

- `std::string` A function in Lua's global table
- [OOLUA::Lua\\_func\\_ref](#) A reference to a function
- `int` A valid stack index

#### 3.2.2.1 Calling a Lua function

A Lua function can be called using the function object [OOLUA::Lua\\_function](#) of which there is an instance bound in the constructor for `Script` [OOLUA::Script::call](#). [OOLUA::Lua\\_function](#) has overloaded function call operators which take upto the maximum defined by "[lua\\_params](#)".

Name:

```
void stringFunc_callsFunctionInGlobalScope_returnsTrue()
{
    m_lua->run_chunk("_G['global_name'] = function() end");
    OOLUA::Lua_function caller(*m_lua);
    CPPUNIT_ASSERT_EQUAL(true, caller("global_name"));
}
```

[Lua\\_func\\_ref](#):

```
void functionRef_functionRefIsFromAChildState_returnsTrue()
{
    using namespace OOLUA; //NOLINT(build/namespaces)
    Lua_func_ref func_from_child = create_func_ref_with_child_state();
    Lua_function caller(*m_lua);
    CPPUNIT_ASSERT_EQUAL(true, caller(func_from_child) );
}
```

#### Valid stack index

```
void indexFunc_passedFunctionIndex_returnsTrue()
{
    OOLUA::Lua_function caller(*m_lua);
    m_lua->load_chunk("return");
    CPPUNIT_ASSERT_EQUAL(true, caller(1));
}
```

### 3.2.3 Table

[Table](#) provides a simple typed C++ interface for the Lua unordered and ordered associative container of the same name. Operations which use the Lua stack ensure that the stack is the same on exit as it was on entry, OOLua tries to force a clean stack([OOLua and the Lua stack](#)).

Any value can be retrieved or set from the table via the use of the template member functions [set](#), [at](#) or [safe\\_at](#). If the value asked for is not the correct type located in the position an error can be reported, the type of which depends on [Error Reporting](#) and the function which was called. See individual member function documentation for details.

#### Note

The member function [try\\_at](#) is only defined when exceptions are enabled for the library.

There are two helper functions for creating a [OOLUA::Table](#) both of which are named [OOLUA::new\\_table](#).

```
void setValue_valueSetInLua_cppSideRepresentationHasChange()
{
    OOLUA::Table t;
    OOLUA::new_table(*m_lua, t);

    m_lua->run_chunk("func = function(t) t['a'] = 1; end");
    m_lua->call("func", t);

    int storedValue(0);
    t.at("a", storedValue);
    CPPUNIT_ASSERT_EQUAL(1, storedValue);
}
```

## 3.3 Proxy

### 3.3.1 DSL

The Domain specific language used for generating C++ bindings for Lua. OOLua provides a DSL for defining C++ types which are to be made available to a Lua script. The intention of this DSL is to hide the details whilst providing a simple and rememberable interface for performing the actions required.

#### Note

"Optional" here means that extra macro parameters are optional, up to the configuration [max](#) for a specific operation.

[Minimalist](#) Generates a proxy function using the only the minimal of information which is generally the name of the thing being proxied and possibly a new name for the proxy. As with taking the address of any C++ function, if there is any ambiguity it will fail to compile, in which case a user should help the compiler by specifying more information using the matching, yet longer named [Expressive](#) DSL entry.

The longer DSL name requires more information.

**Note**

No [Traits](#) can be expressed with this DSL group.

[Expressive](#) Generates a function for which the user has expressed all the parameters for a function these may additionally have [Traits](#).

**3.3.2 Class Proxy**

Generating a proxy for a class normally takes place between two DSL procedures [OOLUA\\_PROXY](#) and [OOLUA\\_PROXY\\_END](#) although alone these do not supply enough information for a proxy to be generated, the following shows the usage of the DSL to proxy and use a C++ class in Lua.

**3.3.2.1 Minimal Class Proxy**

```
struct Stub1 {};
```

To proxy a class and be able to use it in Lua requires a three part process.

**3.3.2.1.1 Proxy Block**

Firstly you create a proxy block which starts with a [OOLUA\\_PROXY](#) call to which you pass the name of the C++ class to be proxied, this block ends at the next [OOLUA\\_PROXY\\_END](#). Soon we will see how to proxy other aspects of a class in this block.

```
OOLUA_PROXY(Stub1)
OOLUA_PROXY_END
```

**3.3.2.1.2 Exporting**

Secondly you export the member functions which are to be made available for the type in Lua. Exporting defines which member functions will be registered with Lua when the class type is registered. Even when there are no member functions to be exported you still need to inform OOLua about this. Calling an [OOLUA\\_EXPORT\\*](#) procedure in a header file is an error that will fail to compile.

**See Also**

[OOLUA\\_EXPORT\\_FUNCTIONS](#)  
[OOLUA\\_EXPORT\\_FUNCTIONS\\_CONST](#)  
[OOLUA\\_EXPORT\\_NO\\_FUNCTIONS](#)

```
OOLUA_EXPORT_NO_FUNCTIONS(Stub1)
```

**3.3.2.1.3 Registering**

Lastly we register the type with a [lua\\_State](#) after which the type can be [created](#) and used in Lua.

```
void setUp()
{
    m_lua = new OOLUA::Script;
    m_lua->register_class<Stub1>();
}

void new_luaCreatesInstance_noException()
{
    CPPUNIT_ASSERT_NO_THROW(m_lua->run_chunk("Stub1.new()"));
}
```

### 3.3.2.2 Tags

Tags specify more information about the class which should be exposed, such as:

- Does the class support any operators?
- Is it abstract ?
- Does the class have enumerations?

#### OOLUA\_TAGS(TagList)

##### Parameters

|                |  |
|----------------|--|
| <i>TagList</i> | Comma separated list of <a href="#">Tags</a> |
|----------------|--|

##### Note

An OOLUA\_TAGS list without any [Tags](#) entries is invalid.

### 3.3.2.3 Default Constructor

The default class constructor is a special member function like C++ and it will be implicitly defined for a type unless [otherwise specified](#). When available for a type "foo" it can be called in Lua using the following syntax.

```
foo.new()
```

##### See Also

[OOLUA::Abstract](#) [OOLUA::No\\_default\\_constructor](#) [OOLUA::No\\_public\\_constructors](#)

### 3.3.2.4 Constructors

#### OOLUA\_CTORS(ConstructorEntriesList)

##### Parameters

|                                |                                    |
|--------------------------------|------------------------------------|
| <i>Constructor-EntriesList</i> | List of <a href="#">OOLUA_CTOR</a> |
|--------------------------------|------------------------------------|

To enable the construction of an instance which is a specific type, there must be constructor(s) for that type registered with OOLua. [OOLUA\\_CTORS](#) is the block into which you can define none default constructor entries using [OOLUA\\_CTOR](#).

Constructors are the only real type of overloading which is permitted by OOLua and there is an important point which should be noted. OOLua will try and match the number of parameters on the stack with the amount required by each OOLUA\_CTOR entry and will look in the order they were defined. When interacting with the Lua stack certain types can not be differentiated between, these include some integral types such as float, int, double etc and types which are of a proxy class type or derived from that type. OOLua implicitly converts between classes in a hierarchy even if a reference is required. This means for example that if there are constructors such as `Foo::Foo(int)` and `Foo::Foo(float)` it will depend on which was defined first in the OOLUA\_CTORS block as to which will be invoked for a call such as `Foo.new(1)`.

##### See Also

[No\\_default\\_constructor](#)

**Note**

An OOLUA\_CTORS block without any OOLUA\_CTOR entries is invalid.

```

OOLUA_PROXY (ParamConstructor)
  OOLUA_TAGS (
    No_default_constructor
  )
  OOLUA_CTORS (
    OOLUA_CTOR (bool) /*NOLINT (readability/casting)*/
    OOLUA_CTOR (int) /*NOLINT (readability/casting)*/
    OOLUA_CTOR (char const*)
    OOLUA_CTOR (int, bool)
    OOLUA_CTOR (Stub1 *) /*NOLINT (readability/casting)*/
    OOLUA_CTOR (Stub1 *, Stub2*)
    OOLUA_CTOR (Stub2)
    OOLUA_CTOR (Stub3*) /*NOLINT (readability/casting)*/
    OOLUA_CTOR (Stub3 const *)
    OOLUA_CTOR (OOLUA::Lua_func_ref)
    OOLUA_CTOR (OOLUA::Table)
  )
OOLUA_PROXY_END

```

**3.3.2.5 Exposing Member Functions****OOLUA\_MFUNC(FunctionName, Optional)****Parameters**

|                     |   |
|---------------------|---|
| <i>FunctionName</i> | Name of the member function to be proxied   |
| <i>Optional</i>     | ProxyFunctionName. Defaults to FunctionName |

**See Also**

[cpp\\_params](#)  
[OOLUA\\_MEM\\_FUNC](#)  
[OOLUA\\_MEM\\_FUNC\\_RENAME](#)

**OOLUA\_MFUNC\_CONST(FunctionName, Optional)****Parameters**

|                     |   |
|---------------------|---|
| <i>FunctionName</i> | Name of the constant function to be proxied |
| <i>Optional</i>     | ProxyFunctionName. Defaults to FunctionName |

**See Also**

[cpp\\_params](#)  
[OOLUA\\_MEM\\_FUNC\\_CONST](#)  
[OOLUA\\_MEM\\_FUNC\\_CONST\\_RENAME](#)

```

//typedef the type of vector into the global namespace
//This is required as a vector has more than one template type
//and the commas in the template confuse a macro.
typedef std::vector<int> vector_int;

OOLUA_PROXY (vector_int)
  //C++11 adds an overload
  //OOLUA_MFUNC (push_back)
  OOLUA_MEM_FUNC (void, push_back, class_::const_reference)
  OOLUA_MFUNC (pop_back)
  OOLUA_MFUNC_CONST (size)
OOLUA_PROXY_END

OOLUA_EXPORT_FUNCTIONS (vector_int, push_back, pop_back)
OOLUA_EXPORT_FUNCTIONS_CONST (vector_int, size)

```

### 3.3.2.6 Abstract Class

Generating an abstract proxy requires that you specify the [Abstract](#) tag in the [OOLUA\\_TAGS](#) block. When OOLua encounters the [Abstract](#) tag it will not look for any constructors for the type and the type will not be constructable from Lua. Specifying an [OOLUA\\_CTORS](#) block will have no effect and such a block will be ignored.

```
class Abstract1
{
public:
    virtual ~Abstract1(){}
    virtual void func1()=0;
    virtual void virtualVoidParam3Int(int, int, int) = 0;
};

OOLUA_PROXY(Abstract1)
    OOLUA_TAGS(Abstract)
    OOLUA_MFUNC(virtualVoidParam3Int)
    OOLUA_MFUNC(func1)
OOLUA_PROXY_END

OOLUA_EXPORT_FUNCTIONS(Abstract1, func1, virtualVoidParam3Int)
OOLUA_EXPORT_FUNCTIONS_CONST(Abstract1)
```

### 3.3.2.7 Base Classes

Using [OOLUA\\_PROXY](#)'s optional parameter(s) specifies base class(es) for the proxy [OOLUA\\_PROXY\(ClassName, Optional\)](#).

#### Parameters

|                  |   |
|------------------|---|
| <i>ClassName</i> | Class to be proxied                       |
| <i>Optional</i>  | Comma seperated list of real base classes |

#### Precondition

Each class specified in *Optional* must be a real base class of *ClassName*.

```
class Derived1Abstract1 : public Abstract1
{
public:
    virtual ~Derived1Abstract1(){}
    MOCK_METHOD0(func1, void());
    MOCK_METHOD3(virtualVoidParam3Int, void(int, int, int));
};

OOLUA_PROXY(Derived1Abstract1, Abstract1)
OOLUA_PROXY_END

OOLUA_EXPORT_FUNCTIONS(Derived1Abstract1)
OOLUA_EXPORT_FUNCTIONS_CONST(Derived1Abstract1)
```

### 3.3.2.8 Operators

[Operator Tags](#) inform OOLua that a class exposes one or more of the operators supported:

- [Less\\_op](#)
- [Equal\\_op](#)
- [Not\\_equal\\_op](#)
- [Less\\_equal\\_op](#)
- [Div\\_op](#)
- [Mul\\_op](#)

- [Sub\\_op](#)
- [Add\\_op](#)

```

class Class_ops
{
public:
    Class_ops(int const & i):m_i(i){}
    Class_ops():m_i(0){}
    Class_ops(Class_ops const& rhs)
        :m_i(rhs.m_i)
    {}

    int const& geti()const
    {
        return m_i;
    }
    bool operator == (Class_ops const& rhs)const
    {
        return m_i == rhs.m_i;
    }
    bool operator < (Class_ops const& rhs)const
    {
        return m_i < rhs.m_i;
    }
    bool operator <= (Class_ops const& rhs)const
    {
        return m_i <= rhs.m_i;
    }
    Class_ops operator + (Class_ops const& rhs)const
    {
        return Class_ops( m_i + rhs.m_i );
    }
    Class_ops operator * (Class_ops const& rhs)const
    {
        return Class_ops(m_i * rhs.m_i);
    }
    Class_ops operator - (Class_ops const& rhs)const
    {
        return Class_ops(m_i - rhs.m_i);
    }
    Class_ops operator / (Class_ops const& rhs)const
    {
        return Class_ops(m_i / rhs.m_i);
    }
private:
    int m_i;
};

```

```

OOLUA_PROXY(Class_ops)
OOLUA_TAGS(
    Equal_op
    , Less_op
    , Less_equal_op
    , Add_op
    , Sub_op
    , Mul_op
    , Div_op
)
OOLUA_MFUNC_CONST(geti)
OOLUA_PROXY_END

```

```

OOLUA_EXPORT_FUNCTIONS(Class_ops)
OOLUA_EXPORT_FUNCTIONS_CONST(Class_ops, geti)

```

### 3.3.2.9 Public Members

[OOLUA\\_MGET\(PublicName, Optional\)](#)

Parameters

|                   |  |
|-------------------|--|
| <i>PublicName</i> | Name of the public variable to be proxied. |
| <i>Optional</i>   | GetterName. Defaults to get_PublicName     |

[OOLUA\\_MSET\(PublicName, Optional\)](#)

**Parameters**

|                   |  |
|-------------------|--|
| <i>PublicName</i> | Name of the public variable to be proxied. |
| <i>Optional</i>   | SetterName. Defaults to set_PublicName     |

[OOLUA\\_MGET\\_MSET\(PublicName, Optional1, Optional2\)](#)

**Parameters**

|                   |  |
|-------------------|--|
| <i>PublicName</i> | Name of the public variable to be proxied. |
| <i>Optional1</i>  | GetterName. Defaults to get_PublicName     |
| <i>Optional2</i>  | SetterName. Defaults to set_PublicName     |

**See Also**

[OOLUA\\_MGET](#) and [OOLUA\\_MSET](#)

**Note**

If one optional parameter is supplied then both must be given.

```
class Public_variables
{
public:
    Public_variables();
    ~Public_variables();
    int an_int;
    int m_int;
    int* int_ptr;
    Stub1* dummy_instance;
    Stub1 dummy_instance_none_ptr;
    Stub1& dummy_ref;

    static const int set_value = 1;
    static const int initial_value = 0;

    Public_variables(Public_variables const&);
    Public_variables& operator = (Public_variables const&);
};

OOLUA_PROXY(Public_variables)
OOLUA_MGET_MSET(an_int)
OOLUA_MGET_MSET(int_ptr, get_int_ptr, set_int_ptr)
OOLUA_MGET_MSET(dummy_instance)
OOLUA_MGET(dummy_ref)
OOLUA_MGET(dummy_instance_none_ptr)
OOLUA_MGET(m_int, get_int)
OOLUA_MGET(m_int)
OOLUA_MSET(m_int, set_int)
OOLUA_MSET(m_int)

OOLUA_PROXY_END

OOLUA_EXPORT_FUNCTIONS(Public_variables
    , set_an_int
    , set_int_ptr
    , set_dummy_instance
    , set_m_int
    , set_int)

OOLUA_EXPORT_FUNCTIONS_CONST(Public_variables
    , get_an_int
    , get_int_ptr
    , get_dummy_instance
    , get_dummy_ref
    , get_dummy_instance_none_ptr
    , get_int
    , get_m_int)
```

**Public member access in Lua is via a member function**

```
void getAnInt_publicVariablesClassPassedToLua_returnsSetValue()
{
```

```

m_class_with_public_vars->an_int = Public_variables::set_value;
m_lua->run_chunk("func = function(obj) return obj:get_an_int() end");
m_lua->call("func", m_class_with_public_vars);
int result;
OOLUA::pull(*m_lua, result);
CPPUNIT_ASSERT_EQUAL(Public_variables::set_value, result);
}

```

### 3.3.2.10 Enumerations

#### OOLUA\_ENUMS(EnumEntriesList)

##### Parameters

|                        |                                    |
|------------------------|------------------------------------|
| <i>EnumEntriesList</i> | List of <a href="#">OOLUA_ENUM</a> |
|------------------------|------------------------------------|

##### Note

An OOLUA\_ENUMS block without any [OOLUA\\_ENUM](#) entries is invalid.

#### OOLUA\_ENUM(EnumName)

##### Parameters

|                 |                            |
|-----------------|----------------------------|
| <i>EnumName</i> | The class enumeration name |
|-----------------|----------------------------|

```

class Enums
{
public:
    enum COLOUR{GREEN = 0, INVALID};
    Enums()
        :m_enum(INVALID)
    {}
    Enums(COLOUR e)
        :m_enum(e)
    {}
    COLOUR m_enum;
    void set_enum(COLOUR e)
    {
        m_enum = e;
    }
    COLOUR get_enum()
    {
        return m_enum;
    }
};

```

```

OOLUA_PROXY(Enums)
    OOLUA_TAGS(
        Register_class_enums
    )
    OOLUA_CTORS(
        OOLUA_CTOR(Enums::COLOUR)
    )
    OOLUA_ENUMS(
        OOLUA_ENUM(GREEN)
        OOLUA_ENUM(INVALID)
    )
    OOLUA_MFUNC(set_enum)
    OOLUA_MFUNC(get_enum)
OOLUA_PROXY_END

```

```

OOLUA_EXPORT_FUNCTIONS_CONST(Enums)
OOLUA_EXPORT_FUNCTIONS(Enums
    , set_enum
    , get_enum)

```

```

void constructWithEnum_passedValueGreen_functionReturnsGreen()
{
    m_lua->register_class<Enums>();
    m_lua->run_chunk("foo = function() "
        "local obj = Enums.new(Enums.GREEN) "
        "return obj:get_enum() "
        "end");
    Enums::COLOUR result(Enums::INVALID);
}

```

```

m_lua->call("foo");
OOLUA::pull(*m_lua, result);
CPPUNIT_ASSERT_EQUAL(Enums::GREEN, result);
}

```

### 3.3.2.11 Static Functions

#### OOLUA\_SFUNC(FunctionName, Optional)

##### Parameters

|                     |   |
|---------------------|---|
| <i>FunctionName</i> | Name of the static function to be proxied   |
| <i>Optional</i>     | ProxyFunctionName. Defaults to FunctionName |

##### Note

This function will not be exported and needs to be registered with OOLua see [OOLUA::register\\_class\\_static](#)

##### See Also

[cpp\\_params](#)

```

class ClassHasStaticFunction
{
public:
    static void static_function(){}
    static void static_function(int /*DontCare*/){}
    static int returns_input(int t){return t;}
};

```

```

OOLUA_PROXY(ClassHasStaticFunction)
    OOLUA_TAGS(No_public_constructors)
    OOLUA_SFUNC(returns_input)
OOLUA_PROXY_END

```

```

OOLUA_EXPORT_NO_FUNCTIONS(ClassHasStaticFunction)

```

## 3.3.3 C Functions

### 3.3.3.1 Minimalist

We have already seen the [Minimalist](#) version in the Hello Moon example.

Deduce and generate a proxy for a C function.

#### OOLUA\_CFUNC(FunctionName, ProxyFunctionName)

##### Parameters

|                           |  |
|---------------------------|--|
| <i>FunctionName</i>       | Name of the C function to be proxied                           |
| <i>ProxyFunction-Name</i> | Name of the function to generate which will proxy FunctionName |

##### See Also

[cpp\\_params](#)

[OOLUA\\_C\\_FUNCTION](#)

```

void say(char const* input)
{
    printf("%s from a standalone function\n", input);
}

```

```

OOLUA_CFUNC(say, l_say)

```

```

void hello_minimalist_function()
{
    using namespace OOLUA; //NOLINT(build/namespaces)
    Script vm;
    set_global(vm, "say", l_say);
    run_chunk(vm, "say('Hello Lua')");
}

```

### 3.3.3.2 Expressive

Generates a block which will call the C function `FunctionName`.

`OOLUA_C_FUNCTION(FunctionReturnType,FunctionName, Optional)`

#### Parameters

|                            |  |
|----------------------------|--|
| <i>FunctionReturn-Type</i> |  |
| <i>FunctionName</i>        |  |
| <i>Optional</i>            | Comma seperated list of function parameter types |

#### See Also

[cpp\\_params](#)

#### Precondition

The function in which this macro is contained must declare a `lua_State` pointer which can be identified by the name "vm"

```

extern void foo(int);
int l_foo(lua_State* vm)
{
    OOLUA_C_FUNCTION(void, foo, int)
}

```

#### Note

This macro should ideally be used as the last operation of a function body as control will return to the caller. Notice there is no return statement in `l_foo`

In the following example we have a C function which is overloaded, we can use the [Expressive](#) DSL here in which we supply the return and parameter types. The function will then be resolved to the correct overload.

```

void expressive_say(char const* input)
{
    printf("%s from a expressive function\n", input);
}
void expressive_say(int input)
{
    printf("Huh %d\n", input);
    CPPUNIT_ASSERT(0);
}

int expressive_lsay(lua_State* vm)
{
    OOLUA_C_FUNCTION(void, expressive_say, char const*)
}

void hello_expressive_function()
{
    using namespace OOLUA; //NOLINT(build/namespaces)
    Script vm;
    set_global(vm, "say", expressive_lsay);
    vm.run_chunk("say('Hello Lua')");
}

```

### 3.3.3.3 Overloaded Minimalist

You may have noticed that we did not apply any [Traits](#) for the [Expressive C version](#), so maybe it would be nice if we could do it another way; well that all depends on what you consider nice! The function can not be resolved unless we give the compiler more information, but in this case it does not mean we have to use the [Expressive](#) DSL. We can instead cast the function pointer, note that a stand alone function name is a function pointer, to the wanted type and therefore resolve to the correct function overload whilst still using the [Minimalist](#) DSL

```
void expressive_say(char const* input)
{
    printf("%s from a expressive function\n", input);
}
void expressive_say(int input)
{
    printf("Huh %d\n", input);
    CPPUNIT_ASSERT(0);
}

OOLUA_CFUNC( (( void(*) (char const*))expressive_say), cast_expressive_say)

void hello_cast_minimalist_function()
{
    using namespace OOLUA; //NOLINT(build/namespaces)
    Script vm;
    set_global(vm, "say", cast_expressive_say);
    vm.run_chunk("say('Hello Lua, we are a cast function not')");
}
```

## 3.3.4 Traits

Provides direction and/or ownership information.

The general naming convention for traits is:

- [Parameter Traits](#) : end in "\_p"
- [Function Return Traits](#) : end in "\_return" or "\_null"
- [Stack Traits](#) : end in "\_ptr".

### 3.3.4.1 Parameter Traits

DSL Traits for function parameter types.

Traits which allow control of ownership include in their name either "lua" or "cpp"; directional traits contain "in", "out" or a combination.

#### 3.3.4.1.1 in\_p

The calling Lua procedure supplies the parameter to the proxied function. No change of ownership occurs.

#### Note

This is the default trait used for function parameters when no trait is supplied.

Member Function:

```
virtual void refPtrConst(ParamType const* & instance) = 0;
```

Proxy Function:

```
OOLUA_MFUNC(refPtrConst)
```

Usage:

```
void inTraitConst_refPtrConst_calledOnceWithCorrectValue()
{
    InHelper helper(m_lua);
    EXPECT_CALL(helper.mock, refPtrConst(::testing::Eq(helper.inputParam_ptrConst))).Times(1);
    helper.run_method();
    m_lua->call(1, helper.object, "refPtrConst", helper.inputParam_ptrConst);
}
```

#### 3.3.4.1.2 out\_p

The calling Lua procedure does not pass the parameter to the proxied function, instead one is created using the default constructor and passed to the proxied function. The result after the proxied call will be returned to the calling procedure. If this is a type which has a proxy then it will cause a heap allocation of the type, which Lua will own.

Member Function:

```
virtual void refPtr(ParamType*& instance) = 0;
```

Proxy Function:

```
OOLUA_MEM_FUNC_RENAME(outTraitRefPtr, void, refPtr, out_p<HasIntMember*&>)
```

Usage:

```
void OutTraitRefPtr_luaPassesNoParam_topOfStackIsOwnedByLua()
{
    ::testing::NiceMock<OutParamUserDataMock> stub;
    m_lua->run_chunk("return function(obj) return obj:outTraitRefPtr() end");
    m_lua->call(1, static_cast<OutParamUserData*>(&stub));
    OOLUA::INTERNAL::Lua_ud * ud = static_cast<OOLUA::INTERNAL::Lua_ud *>(lua_touserdata(*m_lua, -1));
    CPPUNIT_ASSERT_EQUAL(true, OOLUA::INTERNAL::userdata_is_to_be_gcged(ud));
}
```

#### 3.3.4.1.3 in\_out\_p

The calling Lua procedure supplies the parameter to the proxied function, the value of the parameter after the proxied call will be passed back to the calling procedure as a return value. No change of ownership occurs.

Member Function:

```
virtual void ref(ParamType& instance)=0;
```

Proxy Function:

```
OOLUA_MEM_FUNC(void, ref, in_out_p<int*&>)
```

Usage:

```
void inOutTraitRef_luaPassesIntCppAssignsNewValue_returnIsNewlyAssignedValue()
{
    InOutParamHelper helper(m_lua);
    EXPECT_CALL(helper.mock, ref(::testing::_)).Times(1).WillOnce(::testing::SetArgReferee<0>(helper.expected));
    m_lua->run_chunk("return function(object) return object:ref(1) end");
    m_lua->call(1, helper.object);
    assert_top_of_stack_is_expected_value(helper.expected);
}
```

#### 3.3.4.1.4 lua\_out\_p

Lua code does not pass an instance to the C++ function, yet the pushed back value after the function call will be owned by Lua. This is meaningful only if called with a type which has a proxy and it is by reference, otherwise undefined.

Member Function:

```
virtual void refPtr(ParamType*& instance) = 0;
```

Proxy Function:

```
OOlua::MEM_FUNC_RENAME(lua_takes_ownership_of_ref_2_ptr, void, refPtr, lua_out_p<Stub1*>)
```

Usage:

```
m_lua->register_class<OwnershipParamUserData>();
m_lua->run_chunk("return function(object) return object:lua_takes_ownership_of_ref_2_ptr()
end");
m_lua->call(1, object);
//there is now a proxy type on top of the stack which Lua owns
```

### 3.3.4.1.5 cpp\_in\_p

Parameter supplied via Lua changes ownership to C++.

Member Function:

```
virtual void ptr(ParamType* instance) = 0;
```

Proxy Function:

```
OOlua::MEM_FUNC_RENAME(cpp_takes_ownership_of_ptr_param, void, ptr, cpp_in_p<Stub1*>)
```

Usage:

```
void cppInP_ptr2UserData_type_passingPtrThatLuaOwns_topOfStackGcIsFalse()
{
    bool result = returnGarbageCollectValueAfterCppTakingOwnership(
        "cpp_takes_ownership_of_ptr_param");
    CPPUNIT_ASSERT_EQUAL(false, result);
}
```

### 3.3.4.1.6 light\_p

The calling Lua procedure supplies a LUA\_TLIGHTUSERDATA which will be cast to the requested T type. If T is not the correct type for the light userdata then the casting is undefined. A light userdata is never owned by Lua

Member Function:

```
void value(void* void_ptr);
```

Proxy Function:

```
OOlua::MEM_FUNC(void, value, light_p<void*>)
```

Usage:

```
void functionParam_functionWhichTakesVoidPointer_functionIsCalledWithTheCorrectValue()
{
    LightParamUserDataMock mock;
    LightParamUserData* object = &mock;
    m_lua->register_class<LightParamUserData>();
    int i(0);
    void* input_ud = &i;
    EXPECT_CALL(mock, value(::testing::Eq(input_ud))).Times(1);
    m_lua->run_chunk("return function(object,param) return object:value(param) end");
    m_lua->call(1, object, input_ud);
}
```

or

Member Function:

```
void ptr(InvalidStub* data);
```

Proxy Function:

```
OOLUA_MEM_FUNC(void, ptr, light_p<InvalidStub*>)
```

Usage:

```
void functionParam_functionWhichTakesNoneVoidPointer_functionIsCalledWithTheCorrectValue()
{
    LightNoneVoidParamUserDataMock mock;
    LightNoneVoidParamUserData* object = &mock;
    m_lua->register_class<LightNoneVoidParamUserData>();
    InvalidStub lightud;
    void* lightud_ptr = &lightud;
    EXPECT_CALL(mock, ptr(::testing::Eq(lightud_ptr))).Times(1);
    m_lua->run_chunk("return function(object,param) return object:ptr(param) end");
    m_lua->call(1, object, lightud_ptr);
}
```

#### 3.3.4.1.7 calling\_lua\_state

This is different from all other traits as it does not take a type, yet is a type. It informs OOLua that the calling state is a parameter for a function

Member Function:

```
virtual void value(ParamType instance) = 0;
```

Proxy Function:

```
OOLUA_MEM_FUNC(void, value, calling_lua_state)
```

Usage:

```
void callingLuaState_luaPassesNoParameterYetFunctionWantsALuaInstance_calledOnceWithCorrectInstance()
{
    LuaStateParamMock mock;
    lua_State* vm = *m_lua;
    EXPECT_CALL(mock, value(::testing::Eq(vm))).Times(1);

    m_lua->register_class<LuaStateParam>();
    m_lua->run_chunk("return function(object) object:value() end");
    m_lua->call(1, static_cast<LuaStateParam*>(&mock));
}
```

#### 3.3.4.2 Function Return Traits

DSL traits for function return types.

Some of these traits allow for NULL pointers to be returned from functions, which was something commonly requested for the library. When such a trait is used and the runtime value is NULL, Lua's value of nil will be pushed to the stack.

##### 3.3.4.2.1 lua\_return

The type returned from the function is a heap allocated instance whose ownership will be controlled by Lua. This is only valid for function return types.

Member Function:

```
virtual Return* ptr() = 0;
```

Proxy Function:

```
OOLUA_MEM_FUNC(lua_return<Stub1*>, ptr)
```

#### Usage:

```
void luaReturnTrait_callsMethodPtr_returnValueIsToBeGarbageCollected()
{
    ReturnTraitHelper helper(m_lua);
    EXPECT_CALL(helper.mock, ptr()).Times(1).WillOnce(::testing::Return(&helper.return_stub));
    helper.call_object_method("ptr");
    assert_that_tops_gc_flag_is(true);
    set_tops_gc_flag_to(false);
}
```

#### 3.3.4.2.2 maybe\_null

The type returned from the function is a pointer instance whose runtime value maybe NULL. If it is NULL then `lua_pushnil` will be called else the pointer will be pushed as normal. No change of ownership will occur for the type. This is only valid for function return types.

#### Note

To be consistent in naming this should really be called `maybe_null_return`, however I feel this would be too long a name for the trait so "return" has been dropped.

#### Member Function:

```
virtual Returntype * const constPtr() = 0;
```

#### Proxy Function:

```
OOLUA_MEM_FUNC(maybe_null<Stub1*>, ptr)
```

#### Usage:

```
void maybeNullTrait_callsMethodConstPtrWhichReturnsNull_stackTopIsNil()
{
    MaybeNullTraitHelper helper(m_lua);
    EXPECT_CALL(helper.mock, constPtr()).Times(1).WillOnce(::testing::Return(static_cast<Stub1 *const>(
    NULL)));
    helper.call_object_method("constPtr");
    CPPUNIT_ASSERT_EQUAL(LUA_TNIL, lua_type(*m_lua, -1));
}
```

#### 3.3.4.2.3 lua\_maybe\_null

The type returned from the function is a pointer instance whose runtime value maybe NULL. If it is NULL then `lua_pushnil` will be called else the pointer will be pushed and transfer ownership of the instance to Lua. This is only valid for function return types.

#### Note

To be consistent in naming this should really be called `lua_maybe_null_return`, however I feel this would be too long a name for the trait so "return" has been dropped.

#### Member Function:

```
virtual Returntype* ptr() = 0;
```

#### Proxy Function:

```
OOLUA_MEM_FUNC(lua_maybe_null<Stub1*>, ptr)
```

#### Usage:

```
void luaMaybeNullTrait_callsMethodPtrWhichReturnsValidPtr_stackTopGcValueIsTrue()
{
    LuaMaybeNullTraitHelper helper(m_lua);
    EXPECT_CALL(helper.mock, ptr()).Times(1).WillOnce(::testing::Return(&helper.return_stub));
    helper.call_object_method("ptr");
    assert_that_tops_gc_flag_is(true);
    set_tops_gc_flag_to(false);
}
```

#### 3.3.4.2.4 light\_return

The type returned from the function is either a void pointer or a pointer to another type. When the function returns, it will push a `LUA_TLIGHTUSERDATA` to the stack even when the pointer is `NULL`; therefore a `NULL` pointer using this traits is never converted to a Lua `nil` value. A light userdata is also never owned by Lua and `OOLua` does not store any type information for the it; `light_return` is a black box which when used incorrectly will invoke undefined behaviour.

This is only valid for function return types.

Void pointer:

```
OOLUA_MEM_FUNC(light_return<void*>, value)
```

None void pointer:

```
OOLUA_MEM_FUNC(light_return<InvalidStub*>, ptr)
```

#### 3.3.4.3 Stack Traits

Public API traits which control a change of ownership.

Valid to usage for the Public API which interact with the Lua stack.

##### 3.3.4.3.1 cpp\_acquire\_ptr

Informs the library that C++ will take control of the pointer being used and call `delete` on it when appropriate. This is only valid for public API functions which `OOLUA::pull` from the stack.

```
m_lua->run_chunk("return Stub1.new()");
OOLUA::cpp_acquire_ptr<Stub1*> res;
OOLUA::pull(*m_lua, res);
CPPUNIT_ASSERT_EQUAL(true, res.m_ptr != 0);
delete res.m_ptr;
```

##### 3.3.4.3.2 lua\_acquire\_ptr

Informs the library that Lua will take control of the pointer being used and call `delete` on it when appropriate. This is only valid for public API functions which `OOLUA::push` to the stack.

```
void callFunction_passingPointerUsingLuaAcquirePtr_topOfStackGcIsTrue()
{
    Stub1 stub;
    m_lua->run_chunk("foo = function(param) return param end");
    m_lua->call("foo", OOLUA::lua_acquire_ptr<Stub1*>(&stub));
    OOLUA::INTERNAL::Lua_ud * ud = get_ud_helper();
    bool gc_value = OOLUA::INTERNAL::userdata_is_to_be_gcged(ud);
    OOLUA::INTERNAL::userdata_gc_value(ud, false);
    CPPUNIT_ASSERT_EQUAL(true, gc_value);
}
```

#### Note

Here we use the public API function `OOLUA::Script::call` which uses `OOLUA::push`

### 3.3.4.4 Return Order

Lua supports multiple return values for functions ( `return = [explicit]` ). The order of returns in the stack is shown in the following example, simply the first will be pushed to the top of the stack, then the second to the top. This continues until all returns have been pushed on to the stack and the final return is located at the top.

```
void luaReturnOrder_luaFunctionWhichReturnsMultipleValuesToCpp_orderFromTopOfStackIsInput2Input1()
{
    m_lua->run_chunk("return function(input1, input2) return input1, input2 end ");
    int input1(1);
    int input2(2);

    m_lua->call(1, input1, input2);
    /*
    =====
    | input2 | <-- stack top
    =====
    | input1 |
    =====
    | ...   |
    */
    int topOfStack, nextSlot;
    OOLUA::pull(*m_lua, topOfStack);
    OOLUA::pull(*m_lua, nextSlot);

    CPPUNIT_ASSERT_EQUAL(input2, topOfStack);
    CPPUNIT_ASSERT_EQUAL(input1, nextSlot);
}
```

C++ in a way also supports multiple returns via references. Here we have a C++ member function which returns an int, the function also assigns a new value to the parameter which is taken by reference.

```
struct ReturnOrder
{
    enum {returnValue=-1, paramValue};
    int foo(int& bar)
    {
        bar = paramValue;
        return returnValue;
    }
};
```

In effect this function has two return values so one way we could proxy the function and detail that information would be using the [Expressive](#) DSL macro `OOLUA_MEM_FUNC` and applying an `in_out_p` trait to the parameter.

```
OOLUA_PROXY(ReturnOrder)
    OOLUA_MEM_FUNC(int, foo, in_out_p<int&>)
OOLUA_PROXY_END
```

After calling this function there will be two returned values; the return of the C++ function and the value of the parameter after the call. The top of stack will contain the furthest right handside parameter which had an out trait, which in this case there was only one, below this will be proceeding parameters which had out traits and then the return value in that order.

```
void ordering_functionWhichReturnsValueAndTwoInOutParams_orderFromTopOfStackIsParam2Param1Return()
{
    int input1(OutParamsTest::Dummy);
    int input2(OutParamsTest::Dummy);
    run_chunk_function_push_two_ints("return_int_and_2_int_refs", input1, input2, true);
    ::testing::NiceMock<MockOutParamsTest> stub;
    m_lua->call("func", static_cast<OutParamsTest*>(&stub));

    int r1, r2, r3;
    OOLUA::pull(*m_lua, r1); //top of stack
    OOLUA::pull(*m_lua, r2);
    OOLUA::pull(*m_lua, r3);
    CPPUNIT_ASSERT_EQUAL(static_cast<int>(OutParamsTest::Param2), r1);
    CPPUNIT_ASSERT_EQUAL(static_cast<int>(OutParamsTest::Param1), r2);
    CPPUNIT_ASSERT_EQUAL(static_cast<int>(OutParamsTest::Return), r3);
}
```

Are you a bottom up kind of person?

The return value is on the bottom of the stack (Lua stack index 1) with parameter one at index 2.

## Chapter 4

# Library Tests

OOLua is a test driven library which uses two cross platform external libraries for test verification, CppUnit 1.12.1 [1] is used for state based verification and GoogleMock 1.6 [2] for behaviour verification. For anybody who is not familiar with these libraries and would like to know more then I would recommend an IBM article [3] for CppUnit whilst for GoogleMock a recorded presentation by the author [4] additionally the library cheat sheet [5].

### 4.1 Directory Layout

Library test code is situated in a directory named `unit_tests` in the root of the repository [6] or the root of a released source package [7]. This directory has three main sub directories into which the test code is separated.

- `cpp_classes` Classes which will be proxied in tests.
- `bind_classes` The OOLua bindings for the `cpp_classes`.
- `test_classes` Test suites using CppUnit and GoogleMock.

### 4.2 Test Scripts

## Chapter 5

# Change Log

### 5.1 2.0.0

- Pretty much a new [DSL](#) which is not backwards compatible
- Calling static functions in Lua now requires the dot notation
- Calling new in Lua now requires the dot notation
- New [Lua module](#) which generates boilerplate OOLua C++ files, removes old console application
- Added HTML docs and improved inline documentation for DSL, makes online wiki invalid
- Added a new Lua module for [comparisons](#) and updated C++ code, now compares with LuaBind, LuaBridge, SLB3 and SWIG
- Added OOLua version macros [OOLUA\\_VERSION\\_MAJ](#) [OOLUA\\_VERSION\\_MIN](#) and [OOLUA\\_VERSION\\_PATCH](#)
- Base checking no longer touches the Lua stack
- C string traits no longer use a std::string temporary
- Script helper class now has [OOLUA::Script::push](#) and [OOLUA::Script::pull](#) methods
- Bug fix. If an abstract class had a base class which was not abstract, then it was possible to call new on the type.
- Renamed Table::set\_value to [OOLUA::Table::set](#)
- Renamed Table::remove\_value to [OOLUA::Table::remove](#)
- New Lua simplified class format, which improves self call performance
- Extra parameters to bound functions are now ignored. Does not include constructors
- Renamed Script::get\_ptr to [OOLUA::Script::state](#) for consistency
- Added a base class exception type [OOLUA::Exception](#)
- Added [OOLUA::lua\\_return](#) which is a specific trait for return types which will be owned by Lua.
- Added [OOLUA::maybe\\_null](#) which allows C functions and member functions to return NULL
- Added [OOLUA::lua\\_maybe\\_null](#) which allows C functions and member functions to return a runtime value of NULL, if it is not NULL then the instance will be owned by Lua
- Changed [OOLUA\\_C\\_FUNCTION](#), it now requires a [lua\\_State](#) pointer instance identified as "vm" instead of 'l'
- Added [OOLUA::light\\_p](#) This pulls a light userdata from the stack and casts to the requested type

- Added `OOLUA::light_return` This is a function return type which pushes a light userdata onto the stack
- Removed ability for `OOLUA::lua_acquire_ptr` to be used on function returns, use `OOLUA::lua_return` instead
- Removed ability for `OOLUA::cpp_acquire_ptr` to be used for function parameters, use `OOLUA::cpp_in_p` instead
- Modified `OOLUA_MGET`, `OOLUA_MSET` and `OOLUA_MGET_MSET` to use optional parameters.
- Added `oolua_dsl.h` and `oolua_dsl_export.h` which reduces the include graph when using the DSL
- Added `oolua_string.h/c` to make it easier to enable other string types as an integral type. `OOLUA::STRING`
- Bug fix. Prevent exceptions escaping from stand alone functions.
- Bug fix. Incorrect function dispatcher being set on a cached base constant method.
- Removed `OOLUA::register_class_and_bases`, `OOLUA::register_class` now does this.
- Added `OOLUA::idxs_equal` to compare stack indices, may take metamethods into consideration, compatible with Lua 5.1 and 5.2

## 5.2 1.4.0

- Added `OOLUA_DEDUCE_FUNC(_CONST)` for when there is no ambiguity for a function
- Added `OOLUA_TYPEDEFS_END` which is an alias for `OOLUA_END_TYPES` to match the naming of other macros
- Type comparison now uses the address of a template typed function
- Removed `OOLUA_SAFE_ID_COMPARE`
- Added config option `OOLUA_CHECK_EVERY_USERDATA_IS_CREATED_BY_OOLUA`
- Added config option `OOLUA_USERDATA_OPTIMISATION`
- Moved base checking function from the metatable it is now store in `Lua_ud`
- Added new trait `OOLUA::calling_lua_state` which passes allows passing the calling Lua state as a parameter
- Added friendlier registering of class enums
- Added function return traits for a reference to constant `std::string`
- Bug fix Issue 28: Proxy checker typedefs in the default scope instead of public. (Sakamoto)
- Bug fix Issue 29: Lua 5.2 calls `__gc` method with a table. (Iliia Pavlovets)
- Prevent invalid Lua stack indexes when pulling a `Lua_ref` or `Proxy_class`. Indexes Zero (`lua_gettop` result) or -1 with an empty stack.
- Bug fix Issue 30: Table traverse function incorrectly assumes the stack is empty (Steve Nichols)
- Added `oolua_ipairs` and `oolua_ipairs_end` macros for iterating over arrays
- Added `oolua_pairs` and `oolua_pairs_end` macros for iterating over tables
- Removed the `lua_State` parameter from `for_each_key_value` function
- Added bool `OOLUA::can_xmove(lua_State*vm0, lua_State*vm1)`
- `Lua_ref` can safely be moved between related Lua states.
- Added `OOLUA::load_chunk`, `OOLUA::run_chunk`, `OOLUA::run_file` and `OOLUA::load_file`
- Bug fix Issue 25 : Enums being classed as a class type for member functions (Harley Laue)

- Added the ability to pass a stack index as the function to call with `Lua_function`
- Fixed on error `Lua_function` now resets the stack to the same as before entry.
- Added `OOLua` module
- Updated **VA\_ARGS** macro for VS11

## 5.3 1.3.2

- Bug fix Issue 19 : Variadic macros which rename a function
- Added ability to typedef classes inside the `OOLUA` namespace see: [http://groups.google.-com/group/o\(lua-user/browse\\_thread/thread/688ddac870fb76d5](http://groups.google.-com/group/o(lua-user/browse_thread/thread/688ddac870fb76d5)
- Bug fix Issue 22 : Remove return statements which generate warning with gcc (Tim Mensch)
- Refactored so that anything which is not meant to be called by a user, is now in the `OOLUA::INTERNAL` namespace,
- Added compile time constraints to traits
- `OOLUA::cpp_acquire_ptr` and `OOLUA::lua_acquire_ptr` - Type supplied to template is now the real type `<foo*>` or `<foo const*>`
- Bug fix : Converter was not taking the parameter by reference when it needed to.
- Removed the restriction of using classes only in the thread they were created under all conditions

## 5.4 1.3.1

- Work around for Visual Studio as reported by Tom on the mailing list

## 5.5 1.3.0

- Support for limited constructors
- Added a file generator to the generator solution for constructor parameters
- Added the types `OOLUA::No_default_constructor`, `OOLUA::No_public_constructors` and `OOLUA::No_public_destructor` to `oolua_typedefs.h`
- Added `OOLUA_ONLY_DEFAULT_CONSTRUCTOR`
- Broke ABI removing default constructor being forced
- Added `OOLUA::table_set_value` which does not retrieve the table from the registry yet uses a stack index
- Added convenience function `OOLUA::new_table`
- Added copy constructor to `Lua_ref` and `Lua_table`
- Added param traits for `Lua_ref`
- Added push member to `lua_ref`
- Enabled a constructor to take a `Lua_func_ref`
- Bug fix Issue 10 : fixed user type return on the stack (Tomm)
- Enabled a constructor to take a `Lua_table`

- Added method to pull a table reference from the stack
- Enabled a constructor to take a `Lua_table_ref`
- Added a conversion constructor to `Lua_table` from `Lua_ref_table`, introduced a friend hack!!
- Moved the `Lua_table` member function `get_table` to the private interface
- Refactored the pulling of a registry type (`Lua_ref<T>` and `Lua_table`)
- Added pulling a registry type when nil is on the stack, frees the registry ref and sets it to invalid
- Refactored `Lua_table` removing the `lua_State` instead using the reference's state member
- Added a default implementation of `Proxy_class` which creates a typedef that identifies it as a none proxy type
- Bug fix : Public members retrieved with `get_?`, now push by reference if the type has a proxy type and it is by value
- Visual Studio work around for when taking the address of a function
- Added quotation marks to `TargetPath` as a post build event in visual studio. Directories with a space caused a problem.
- Added check to make sure a user data type was created by `OOLUA` when pulling a class from the stack
- Bypassed checking the user data type when calling a member function on that instance
- Changed the internal registration key of the function which checks a class bases
- Added support for building and running unit tests with vs2010 and gmock 1.5
- Updated generator project to include C function wrappers
- Added C function wrappers
- Moved build scripts to "build\_scripts" directory
- Added `oolua_config.h`
- Added config option `OOLUA_RUNTIME_CHECKS_ENABLED`
- Added config option `OOLUA_STD_STRING_IS_INTEGRAL`
- How errors are reported now depend on which language called the function and the settings in `oolua_config.h`
- `OOLUA::push2lua` now returns a boolean which is the result of the operation, if exceptions are enabled it throws on error
- `OOLUA::Lua_function` now adds a traceback (copied from Lua code) which is enabled with `OOLUA_DEBUG_CHECKS`
- Operator functions now use the `OOLUA::LUA_CALLED::pull2cpp` functions which act differently to `OOLUA::pull2cpp` on an error
- `OOLUA::Lua_ref` has two extra functions to be used via Lua code, `lua_pull` and `lua_push`
- Bug fix : `OOLUA::Lua_table`'s `safe_at` now does the correct thing when exceptions are enabled and does not let an exception escape.
- Added definition of `OOLUA::get_last_error` even if store last error is not enabled, in this instance it is a no op.
- Exceptions now can pop the error of the Lua stack and `Runtime_error` can be initialised with a string
- `oolua_member_function.h`'s proxy calling functions now wrap code in a try block if exceptions are enabled.
- Removed `LUA_GLOBALSINDEX` define from `lua_includes` when using Lua 5.2 instead `lua_getglobal` and `lua_setglobal` are used throughout

- Added support for `std::string` to have embedded nulls as suggested by Tomm on the mailing list
- Moved C++ classes used in tests to `cpp_classes` directory
- Moved OOLua proxy classes used in tests to `bind_classes` directory
- Moved all unit tests to the `unit_tests` directory
- Added string is integral unit test
- `Table::pull_from_stack` now returns a bool to indicate the result if called by C++ code and not using exceptions
- Added `unit_test_config(root,name)` to premake helper file
- Added support for **VA\_ARGS** macros with one or more arguments
- Added support for **VA\_ARGS** macros with zero arguments using compiler extensions
- Added helper function `OOLUA::get_global`
- Added helper function `OOLUA::set_global`
- Added helper function `OOLUA::set_global_to_nil`
- Bug fix : Calling a static function on a derived instance when the function was registered with a base class

## 5.6 1.2.2

- Converted Premake scripts to Premake4
- Optimised the checking of a type against a requested type
- Userdata name now changes when it's constant status in `set_type_top_to_none_const`
- Added Xcode support to Premake scripts
- Added xcode test unit bash build script.
- Build logs directed to there own directory
- Added new test project "tests\_may\_fail" for issue 7
- Updated bash build scripts to run the tests\_may\_fail aswell as unit.tests
- Added a readme.txt with details of library as many download locations are now available
- Bug fix Issue 8 : Passing a c style string to a member function bug as reported by (airbash)
- Bug fix Issue 8 : A corresponding bug of a member function which returns a c style string.
- Added define in `lua_includes.h` to support Lua 5.2 and 5.1.4 simultaneously
- Renamed platform test scripts
- Added build scripts to create a local install

## 5.7 1.2.1

- Was actually 1.2.0 yet due to a packaging error had to be incremented.

## 5.8 1.2.0

- Added fields to Lua\_ud which are used for comparison removing the metatable raw\_equals.
- Added name\_size to proxy classes and updated the generation file to reflect changes.
- Changed headers that used old licence.
- Added a function to register a type and all it's bases.
- Added a couple of profile tests in the directory profile.

## 5.9 1.1.0

- Removed the dynamic allocation of Proxy classes to use stack versions.

## 5.10 1.0.0

- First public release

## Chapter 6

# Library Comparisons

### 6.1 Introduction

The intention of the comparison is to give both you and I some ball park costs and were originally based on a Gem [1]; an excellent side effect from the libraries compared, other than SWIG, is that they have seen an optimisation improvement as a result.

Previous versions of these comparisons were perceived by some difficult to fully understand what a number meant in relation to others, without also understanding some of the differences between libraries; additionally there was a concern that the cost of the method look up should not be part of the comparison.

#### 6.1.1 Userdata verification

Although the comparisons ran the same code when being timed, it was not simply a case of a one to one mapping between the different libraries. Most concerning to some was the fact that as a library feature LuaBind verified a userdata was created by itself whilst SWIG and originally OOLua did not perform such a check, thus OOLua and SWIG benefited whilst LuaBind was penalised.

Depending on your requirements SWIG, OOLua and LuaBind can all be compiled so that they do not perform these userdata checks, the potential problem this introduces can be shown with the following Lua 5.1 snippets:

```
--Calling a member function passing a none library userdata
local cached_func = obj.func
cached_func( newproxy() )
```

or

```
--Passing a none library userdata when one is needed
obj.func( newproxy() )
```

When an incorrect userdata is encountered which maybe from an external module or from a Lua script such as in the examples; then best case scenario is the library will detect it, yet in the process could cause undefined behaviour, and worst case maybe a segfault or your toaster runs off with the next door neighbour's.

To compile OOLua and LuaBind to use the same behaviour as SWIG

- OOLua: define OOLUA\_CHECK\_EVERY\_USERDATA\_IS\_CREATED\_BY\_OOLUA 0
- LuaBind: define LUABIND\_DISABLE\_UD\_CHECK and add the following macro guard to object\_rep.cpp

```
LUABIND_API object_rep* get_instance(lua_State* L, int index)
{
    object_rep* result = static_cast<object_rep*>(lua_touserdata(L, index));

#ifdef LUABIND_DISABLE_UD_CHECK
    if (!result || !lua_getmetatable(L, index))
```

```

        return 0;

lua_rawgeti(L, -1, 1);

if (lua_tocfunction(L, -1) != &get_instance_value)
    result = 0;

lua_pop(L, 2);
#endif
return result;
}

```

For this reason the comparisons are performed for libraries with this feature enabled and disabled where possible, otherwise the category a library falls into by default.

#### Note

It is my belief that a determined party could possibly craft malicious code that will pass most library userdata checks, as essentially they all boil down to doing a check and if it passes then casting a void pointer to a type, some actually perform an undefined cast before any such check passes.[\[2\]](#)

### 6.1.2 Function caching

A Lua self call `self:func()` is functionally the same as `self.func(self)`, it is also normal and recommended usage in certain situations to cache values to locals. The comparison code is run in such a formentioned situation with tight loops, so if it were normal user code you would generally cache the member function as shown in the following example. Otherwise it would repeatedly pay for the function look up when the object types are the same, whilst that is a valid concern my observed usage of C++ binding libraries is via an object call hence OOLua.

```

, mfunc_cached = function(object)
    local ave = 0
    local func = object.get
    for i = 0, N do
        local t0 = clock()
        for i=1,times do
            func(object)
        end
        local dt = clock()-t0
        if i~=0 then
            ave = ave + dt
        end
    end
    return (ave/N)/times
end

```

For this reason the comparisons are performed for libraries both with caching function and self calls.

## 6.2 Comparison code

### 6.2.1 C++

The comparisons are performed using library bindings to the following C++ classes

```

class Set_get
{
public:
    Set_get():_i(0.0){}
    void set(double i)
    {
        _i = i;
    }
    double get()const
    {
        return _i;
    }
private:
    double _i;
};

class ProfileBase
{
public:
    ProfileBase():_i(0){}
    virtual ~ProfileBase(){}
    void increment_a_base(ProfileBase* base)
    {
        ++base->_i;
    }
    virtual void virtual_func()
    {
        ++_i;
    }
    virtual void pure_virtual_func() = 0;
private:
    int _i;
};

class ProfileAnotherBase
{
public:
    virtual ~ProfileAnotherBase(){}
};

class ProfileDerived : public ProfileBase
{
public:
    virtual ~ProfileDerived(){}
    virtual void pure_virtual_func()
    {
        ++_i;
    }
private:
    int _i;
};

class ProfileMultiBases : public ProfileDerived, public ProfileAnotherBase
{
public:
    void virtual_func()
    {
        ++_i;
    }
private:
    int _i;
};

```

## 6.2.2 Lua

The different types of function calls are ran using the following Lua module.

```

]]
local clock = os.clock
local N = 10
local times = 1000000

return
{
    vfunc_self = function(object)
        local ave = 0
        if not object.virtual_func then return -1 end
        for i = 0, N do

```

```

        local t0 = clock()
        for i=1,times do
            object:virtual_func()
        end
        local dt = clock()-t0
        if i~=0 then
            ave = ave + dt
        end
    end
    return (ave/N)/times
end

,vfunc_cached = function(object)
    local ave = 0
    if not object.virtual_func then return -1 end
    for i = 0, N do
        local cached_vfunc = object.virtual_func
        local t0 = clock()
        for i=1,times do
            cached_vfunc(object)
        end
        local dt = clock()-t0
        if i~=0 then
            ave = ave + dt
        end
    end
    return (ave/N)/times
end

,mfunc_self = function(object)
    local ave = 0
    for i = 0, N do
        local t0 = clock()
        for i=1,times do
            object:get()
        end
        local dt = clock()-t0
        if i~=0 then
            ave = ave + dt
        end
    end
    return (ave/N)/times
end
--
,mfunc_cached = function(object)
    local ave = 0
    local func = object.get
    for i = 0, N do
        local t0 = clock()
        for i=1,times do
            func(object)
        end
        local dt = clock()-t0
        if i~=0 then
            ave = ave + dt
        end
    end
    return (ave/N)/times
end
--
,increment_a_base_self = function(object,param)
    local ave = 0
    for i = 0, N do
        local t0 = clock()
        for i=1,times do
            object:increment_a_base(param)
        end
        local dt = clock()-t0
        if i~=0 then
            ave = ave + dt
        end
    end
    return (ave/N)/times
end

,increment_a_base_cached = function(object,param)
    local ave = 0
    local func = object.increment_a_base
    for i = 0, N do
        local t0 = clock()
        for i=1,times do
            func(object,param)
        end
        local dt = clock()-t0
        if i~=0 then
            ave = ave + dt
        end
    end

```

```

        end
        return (ave/N)/times
    end
}

## Chapter 7

# Deprecated List

Member [OOLUA::Table::traverse](#) (traverse\_do\_function do\_)

## Chapter 8

# Module Index

### 8.1 Modules

Here is a list of all modules:

|                                  |    |
|----------------------------------|----|
| Library Configuration . . . . .  | 55 |
| File Generation . . . . .        | 57 |
| Error Reporting . . . . .        | 71 |
| Exception classes . . . . .      | 75 |
| Error Checking . . . . .         | 73 |
| Known limitations . . . . .      | 59 |
| DSL . . . . .                    | 60 |
| Expressive . . . . .             | 64 |
| Minimalist . . . . .             | 67 |
| Exporting . . . . .              | 69 |
| Traits . . . . .                 | 76 |
| Parameter Traits . . . . .       | 77 |
| Function Return Traits . . . . . | 78 |
| Stack Traits . . . . .           | 79 |
| Tags . . . . .                   | 80 |
| Operator Tags . . . . .          | 81 |

## Chapter 9

# Namespace Index

### 9.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

|                               |  |    |
|-------------------------------|--|----|
| <a href="#">OOLUA</a>         | This is the root namespace of the Library . . . . .  | 83 |
| <a href="#">OOLUA::STRING</a> | Defines which type of string classes can be pulled and pushed from the stack with the public API and the DSL . . . . . | 97 |

## Chapter 10

# Hierarchical Index

### 10.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

|  |     |
|--|-----|
| OOLUA::Abstract . . . . .                              | 99  |
| OOLUA::Add_op . . . . .                                | 99  |
| OOLUA::calling_lua_state . . . . .                     | 99  |
| OOLUA::cpp_acquire_ptr< T > . . . . .                  | 100 |
| OOLUA::cpp_acquire_ptr< ParamConstructor * > . . . . . | 100 |
| OOLUA::cpp_in_p< T > . . . . .                         | 100 |
| OOLUA::Div_op . . . . .                                | 100 |
| OOLUA::Equal_op . . . . .                              | 101 |
| OOLUA::Exception . . . . .                             | 101 |
| OOLUA::File_error . . . . .                            | 101 |
| OOLUA::Memory_error . . . . .                          | 115 |
| OOLUA::Runtime_error . . . . .                         | 118 |
| OOLUA::Syntax_error . . . . .                          | 123 |
| OOLUA::Type_error . . . . .                            | 127 |
| HasIntMember . . . . .                                 | 102 |
| Hello_moon . . . . .                                   | 102 |
| OOLUA::in_out_p< T > . . . . .                         | 103 |
| OOLUA::in_p< T > . . . . .                             | 103 |
| OOLUA::in_p< char * > . . . . .                        | 104 |
| OOLUA::Less_equal_op . . . . .                         | 104 |
| OOLUA::Less_op . . . . .                               | 104 |
| OOLUA::light_p< T > . . . . .                          | 104 |
| OOLUA::light_return< T > . . . . .                     | 105 |
| OOLUA::lua_acquire_ptr< T > . . . . .                  | 105 |
| OOLUA::Lua_function . . . . .                          | 106 |
| OOLUA::lua_maybe_null< T > . . . . .                   | 111 |
| OOLUA::lua_out_p< T > . . . . .                        | 111 |
| OOLUA::Lua_ref< ID > . . . . .                         | 112 |
| OOLUA::Lua_ref< LUA_TTABLE > . . . . .                 | 112 |
| OOLUA::lua_return< T > . . . . .                       | 113 |
| lua_State . . . . .                                    | 114 |
| OOLUA::maybe_null< T > . . . . .                       | 114 |
| OOLUA::Mul_op . . . . .                                | 115 |
| OOLUA::No_default_constructor . . . . .                | 115 |
| OOLUA::No_public_constructors . . . . .                | 116 |
| OOLUA::No_public_destructor . . . . .                  | 116 |
| OOLUA::Not_equal_op . . . . .                          | 116 |
| OOLUA::out_p< T > . . . . .                            | 117 |

|                                       |     |
|---------------------------------------|-----|
| OutParamsUserData . . . . .           | 117 |
| MockOutParamsUserData . . . . .       | 115 |
| OOLUA::Proxy_class< T > . . . . .     | 117 |
| OOLUA::Register_class_enums . . . . . | 118 |
| ReturnOrder . . . . .                 | 118 |
| Say . . . . .                         | 119 |
| OOLUA::Script . . . . .               | 119 |
| Stub1 . . . . .                       | 122 |
| Stub2 . . . . .                       | 122 |
| OOLUA::Sub_op . . . . .               | 122 |
| OOLUA::Table . . . . .                | 123 |
| TestingReturnOrder . . . . .          | 126 |

# Chapter 11

## Class Index

### 11.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

|   |     |
|---|-----|
| <a href="#">OOLUA::Abstract</a>                     |     |
| The class being mirrored is an abstract class       | 99  |
| <a href="#">OOLUA::Add_op</a>                       |     |
| Addition operator is defined for the type           | 99  |
| <a href="#">OOLUA::calling_lua_state</a>            |     |
| Special parameter type                              | 99  |
| <a href="#">OOLUA::cpp_acquire_ptr&lt; T &gt;</a>   |     |
| Change of ownership to C++                          | 100 |
| <a href="#">OOLUA::cpp_in_p&lt; T &gt;</a>          |     |
| Input parameter trait which will be owned by C++    | 100 |
| <a href="#">OOLUA::Div_op</a>                       |     |
| Division operator is defined for the type           | 100 |
| <a href="#">OOLUA::Equal_op</a>                     |     |
| Equal operator is defined for the type              | 101 |
| <a href="#">OOLUA::Exception</a>                    |     |
| Base class for OOLua exceptions                     | 101 |
| <a href="#">OOLUA::File_error</a>                   |     |
| Reports LUA_ERRFILE                                 | 101 |
| <a href="#">HasIntMember</a>                        | 102 |
| <a href="#">Hello_moon</a>                          | 102 |
| <a href="#">OOLUA::in_out_p&lt; T &gt;</a>          |     |
| Input and output parameter trait                    | 103 |
| <a href="#">OOLUA::in_p&lt; T &gt;</a>              |     |
| Input parameter trait                               | 103 |
| <a href="#">OOLUA::in_p&lt; char * &gt;</a>         |     |
| Specialisation for C style strings                  | 104 |
| <a href="#">OOLUA::Less_equal_op</a>                |     |
| Less than or equal operator is defined for the type | 104 |
| <a href="#">OOLUA::Less_op</a>                      |     |
| Less than operator is defined for the type          | 104 |
| <a href="#">OOLUA::light_p&lt; T &gt;</a>           |     |
| Input parameter trait                               | 104 |
| <a href="#">OOLUA::light_return&lt; T &gt;</a>      |     |
| Return trait for a light userdata type              | 105 |
| <a href="#">OOLUA::lua_acquire_ptr&lt; T &gt;</a>   |     |
| Change of ownership to Lua                          | 105 |
| <a href="#">OOLUA::Lua_function</a>                 |     |
| Structure which is used to call a Lua function      | 106 |

|   |     |
|---|-----|
| <a href="#">OOLUA::lua_maybe_null&lt; T &gt;</a>  |     |
| Return trait for a pointer which at runtime maybe NULL and also allowing transfer of ownership                  | 111 |
| <a href="#">OOLUA::lua_out_p&lt; T &gt;</a>   |     |
| Output parameter trait which will be owned by Lua   | 111 |
| <a href="#">OOLUA::Lua_ref&lt; ID &gt;</a>  |     |
| A typed wrapper for a Lua reference   | 112 |
| <a href="#">OOLUA::lua_return&lt; T &gt;</a>  |     |
| Return trait for a type which will be owned by Lua  | 113 |
| <a href="#">lua_State</a>   |     |
| Lua virtual machine   | 114 |
| <a href="#">OOLUA::maybe_null&lt; T &gt;</a>  |     |
| Return trait for a pointer which at runtime maybe NULL  | 114 |
| <a href="#">OOLUA::Memory_error</a>   |     |
| Reports LUA_ERRMEM  | 115 |
| <a href="#">MockOutParamsUserData</a>   | 115 |
| <a href="#">OOLUA::Mul_op</a>   |     |
| Multiplication operator is defined for the type   | 115 |
| <a href="#">OOLUA::No_default_constructor</a>   |     |
| There is not a default constructor in the public interface yet there are other constructors                     | 115 |
| <a href="#">OOLUA::No_public_constructors</a>   |     |
| There are no constructors in the public interface   | 116 |
| <a href="#">OOLUA::No_public_destructor</a>   |     |
| There is not a destructor in the public interface and OOLua will not attempt to delete an instance of this type | 116 |
| <a href="#">OOLUA::Not_equal_op</a>   |     |
| Not equal operator is defined for the type  | 116 |
| <a href="#">OOLUA::out_p&lt; T &gt;</a>   |     |
| Output parameter trait  | 117 |
| <a href="#">OutParamsUserData</a>   | 117 |
| <a href="#">OOLUA::Proxy_class&lt; T &gt;</a>   |     |
| A template wrapper for class objects of type T used by the script binding                                       | 117 |
| <a href="#">OOLUA::Register_class_enums</a>   |     |
| The class has enums to register   | 118 |
| <a href="#">ReturnOrder</a>   | 118 |
| <a href="#">OOLUA::Runtime_error</a>  |     |
| Reports LUA_ERRRUN  | 118 |
| <a href="#">Say</a>   | 119 |
| <a href="#">OOLUA::Script</a>   |     |
| OOLua helper class  | 119 |
| <a href="#">Stub1</a>   | 122 |
| <a href="#">Stub2</a>   | 122 |
| <a href="#">OOLUA::Sub_op</a>   |     |
| Subtraction operator is defined for the type  | 122 |
| <a href="#">OOLUA::Syntax_error</a>   |     |
| Reports LUA_ERRSYNTAX   | 123 |
| <a href="#">OOLUA::Table</a>  |     |
| Wrapper around a table in Lua which allows easy usage   | 123 |
| <a href="#">TestingReturnOrder</a>  | 126 |
| <a href="#">OOLUA::Type_error</a>   |     |
| Reports that a type pulled from the stack was not the type that was asked for                                   | 127 |

## Chapter 12

# File Index

### 12.1 File List

Here is a list of all documented files with brief descriptions:

|   |     |
|---|-----|
| <a href="#">dsl_va_args.h</a>   | 129 |
| <a href="#">lua_includes.h</a>  |     |
| Prevents name mangling and provides a potential location to enable compatibility when new Lua versions are released   | 130 |
| <a href="#">lvd_type_traits.h</a>   |     |
| Template struct which report if the type has qualifiers and also removes some of the possible qualifiers  | 130 |
| <a href="#">lvd_types.h</a>   | 130 |
| <a href="#">only_for_doxygen.h</a>  | 130 |
| <a href="#">oolua.h</a>   | 131 |
| <a href="#">oolua_boilerplate.h</a>   | 131 |
| <a href="#">oolua_chunk.h</a>   |     |
| Provides methods for running and loading chunks   | 132 |
| <a href="#">oolua_config.h</a>  | 132 |
| <a href="#">oolua_dsl.h</a>   | 133 |
| <a href="#">oolua_dsl_export.h</a>  | 133 |
| <a href="#">oolua_error.h</a>   |     |
| Generic header to be included when handling errors  | 133 |
| <a href="#">oolua_exception.h</a>   | 134 |
| <a href="#">oolua_function.h</a>  |     |
| Provides the class <a href="#">OOLUA::Lua_function</a> which is a helper for calling Lua functions  | 134 |
| <a href="#">oolua_helpers.h</a>   | 135 |
| <a href="#">oolua_open.h</a>  |     |
| Sets up the a Lua Universe to work with the library   | 135 |
| <a href="#">oolua_pull.h</a>  | 136 |
| <a href="#">oolua_push.h</a>  | 136 |
| <a href="#">oolua_registration.h</a>  | 137 |
| <a href="#">oolua_registration_fwd.h</a>  | 138 |
| <a href="#">oolua_script.h</a>  |     |
| Provides the helper class <a href="#">OOLUA::Script</a>   | 138 |
| <a href="#">oolua_stack.h</a>   |     |
| Makes available implementations for the stack operations <a href="#">OOLUA::push</a> and <a href="#">OOLUA::pull</a> , which have forward declarations in <a href="#">oolua_stack_fwd.h</a> | 139 |
| <a href="#">oolua_stack_fwd.h</a>   | 139 |
| <a href="#">oolua_table.h</a>   | 141 |
| <a href="#">oolua_traits_fwd.h</a>  | 143 |
| <a href="#">oolua_version.h</a>   |     |
| OOLua library version information for both the CPP and at run time  | 143 |

|   |     |
|---|-----|
| <a href="#">platform_check.h</a>  | 144 |
| <a href="#">proxy_base_checker.h</a>  |     |
| Checks the heirachcal bases to ensure a cast is defined   | 144 |
| <a href="#">proxy_caller.h</a>  |     |
| Provides implementations which actually call the member or stand alone function, it also pushes<br>a function return to the stack if the fubction has one         | 145 |
| <a href="#">proxy_class.h</a>   | 145 |
| <a href="#">proxy_constructor.h</a>   | 146 |
| <a href="#">proxy_constructor_param_tester.h</a>  |     |
| Helps test that a constructor parameter is of the requested type so that a matching constructor<br>can be called  | 146 |
| <a href="#">proxy_function_dispatch.h</a>   | 147 |
| <a href="#">proxy_function_exports.h</a>  | 147 |
| <a href="#">proxy_member_function.h</a>   |     |
| Internal macros which generate proxy member functions   | 147 |
| <a href="#">proxy_none_member_function.h</a>  |     |
| Contains internal macros for proxying none member functions   | 147 |
| <a href="#">proxy_operators.h</a>   | 148 |
| <a href="#">proxy_public_member.h</a>   |     |
| Proxies a class public member variable  | 148 |
| <a href="#">proxy_stack_helper.h</a>  | 149 |
| <a href="#">proxy_tags.h</a>  | 149 |
| <a href="#">proxy_userdata.h</a>  |     |
| Contains the internal userdata type used by OOLua to represent C++ class types, also contains<br>inlined functions for checking and setting flags in the userdata | 150 |
| <a href="#">type_list.h</a>   | 150 |
| <a href="#">typelist_structs.h</a>  | 150 |

# Chapter 13

## Module Documentation

### 13.1 Library Configuration

#### Modules

- [File Generation](#)  
*Lua module for generating configurable OOLua boilerplate code.*
- [Error Reporting](#)  
*Defines how any errors are reported.*
- [Error Checking](#)  
*Defines the type of checks which will be performed.*

#### Macros

- `#define OOLUA_STD_STRING_IS_INTEGRAL`  
**Default:** *Enabled*

#### 13.1.1 Detailed Description

—[[

INTERNALINTERNAL

OOLua is easily configurable in two areas errors( [Error Reporting](#) , [Error Checking](#) ) and limits ( [File Generation](#) ).

#### 13.1.2 Macro Definition Documentation

##### 13.1.2.1 `#define OOLUA_STD_STRING_IS_INTEGRAL`

**Default:** Enabled

Allows std::string to be a parameter or a return type for a function.

#### Note

This is always by value

## Parameters

|          |          |
|----------|----------|
| <i>0</i> | Disabled |
| <i>1</i> | Enabled  |

## 13.2 File Generation

Lua module for generating configurable OOLua boilerplate code.

### Functions

- function `gen` (options, path)  
*Generate boilerplate header files.*
- function `defaults` ()  
*Gets the default options as key(string) and value(number) entries in a table.*

#### 13.2.1 Detailed Description

Lua module for generating configurable OOLua boilerplate code. The "`oolua_generate`" Lua module provides information about the default limits and allows generation of boilerplate code using user defined limits or regeneration with default values, the details of these being :

```
return
{
  lua_params =
  {
    desc = 'Maximum amount of parameters for a call to a Lua function'
    , value=10
  }
  , cpp_params =
  {
    desc='Maximum number of parameters a C++ function can have'
    , value=8
  }
  , constructor_params =
  {
    desc='Maximum amount of parameters for a constructor of a proxied type'
    , value=5
  }
  , class_functions =
  {
    desc='Maximum amount of class functions that can be registered for each proxied type'
    , value=15
  }
}
```

The most common change to these options is the number of functions which can be registered for a proxy class, this limit applies individually to constant and none constant functions, base class methods that are registered in a base class do not decrease the count for a derived class.

Using the Lua interpreter to regenerate the OOLua files increasing this option whilst using default values for the remaining options:

```
lua -e "require'build_scripts.oolua_generate'.gen({class_functions=30},'include/')"

```

For convenience you do not need a version of Lua installed on a machine to run this module, Premake the project file generator used in OOLua already contains a copy of Lua 5.1 (it has some modifications to the core libraries). To generate the files with the same options as above :

```
premake4 --class_functions=30 oolua-gen

```

The module returns a table with the following functions

```
return { gen = gen, defaults=defaults, default_details=default_details }
```

## 13.2.2 Function Documentation

### 13.2.2.1 function defaults ( )

Gets the default options as key(string) and value(number) entries in a table.

Modifies the table returned by default\_details so the it is formatted correctly for any functions it will be passed to.

#### Returns

Table of the format { config\_option = 0 }

#### See Also

default\_details

### 13.2.2.2 function gen ( options , path )

Generate boilerplate header files.

#### Parameters

|                |   |
|----------------|---|
| <i>options</i> | [optional] Defaults to the library <a href="#">defaults</a> |
| <i>path</i>    | [optional] Defaults to the current working directory        |

Generates boilerplate C++ files code required for OOLua using the passed options or if an option is not present then the default is used. If Path is not nil then it is required to be a string which is slash postfixed.

## 13.3 Known limitations

### 13.3.1 Incorrect creation of userdata

OOLua incorrectly creates a new userdata when it should reuse one which has already been created.

See Also

<http://code.google.com/p/oolua/issues/detail?id=5>

```
void differentRootsOfaTree_twoRootsPassedToLua_luaUdComparesEqual()
{
    OOLUA::register_class<DerivedFromTwoAbstractBasesAndAbstract3>(*m_lua);
    DerivedFromTwoAbstractBasesAndAbstract3 derived;
    Abstract2* a2 = &derived;
    Abstract3* a3 = &derived;
    OOLUA::push(*m_lua, a2);
    OOLUA::push(*m_lua, a3);
    OOLUA::INTERNAL::Lua_ud* ud_a2 = static_cast<OOLUA::INTERNAL::Lua_ud*>(lua_touserdata(*m_lua, -2));
    OOLUA::INTERNAL::Lua_ud* ud_a3 = static_cast<OOLUA::INTERNAL::Lua_ud*>(lua_touserdata(*m_lua, -1));
    CPPUNIT_ASSERT_EQUAL(true, ud_a2 == ud_a3);
}
```

## 13.4 DSL

The Domain specific language used for generating C++ bindings for Lua.

### Modules

- [Expressive](#)  
*Generates code where all details are expressed.*
- [Minimalist](#)  
*Generates code using the minimal information.*
- [Exporting](#)  
*Exports member functions.*

### Macros

- `#define OOLUA_PROXY(...)`  
*Starts the generation a proxy class.*
- `#define OOLUA_TAGS(...)`  
*Allows more information to be specified about the proxy class.*
- `#define OOLUA_PROXY_END`  
*Ends the generation of the proxy class.*
- `#define OOLUA_ENUM(EnumName)`  
*Creates a entry into a [OOLUA\\_ENUMS](#) block.*
- `#define OOLUA_ENUMS(EnumEntriesList)`  
*Creates a block into which enumerators can be defined with [OOLUA\\_ENUM](#).*
- `#define OOLUA_CTOR(...)`  
*Generates a constructor in a constructor block.*
- `#define OOLUA_CTORS(ConstructorEntriesList)`  
*Creates a block into which none default constructors can be defined with [OOLUA\\_CTOR](#).*
- `#define OOLUA_MGET(...)`  
*Generates a getter, which is a constant function, to retrieve a public instance.*
- `#define OOLUA_MSET(...)`  
*Generates a setter, which is a none constant function, to set the public instance.*
- `#define OOLUA_MGET_MSET(...)`  
*Generates a getter and setter for a public instance.*

#### 13.4.1 Detailed Description

The Domain specific language used for generating C++ bindings for Lua. OOLua provides a DSL for defining C++ types which are to be made available to a Lua script. The intention of this DSL is to hide the details whilst providing a simple and rememberable interface for performing the actions required.

#### Note

"Optional" here means that extra macro parameters are optional, up to the configuration [max](#) for a specific operation.

### 13.4.2 Macro Definition Documentation

#### 13.4.2.1 #define OOLUA\_CTOR( ... )

Generates a constructor in a constructor block.

See Also

[OOLUA\\_CTORS](#)

[OOLUA\\_CTOR\( ConstructorParameterList\)](#)

Parameters

|                                  |                                    |
|----------------------------------|------------------------------------|
| <i>Constructor-ParameterList</i> | Comma separated list of parameters |
|----------------------------------|------------------------------------|

Precondition

Size of ConstructorParameterList >0 and <= "[constructor\\_params](#)"

See Also

[constructor\\_params](#)

#### 13.4.2.2 #define OOLUA\_CTORS( ConstructorEntriesList )

Creates a block into which none default constructors can be defined with [OOLUA\\_CTOR](#).

[OOLUA\\_CTORS\(ConstructorEntriesList\)](#)

Parameters

|                                |                                    |
|--------------------------------|------------------------------------|
| <i>Constructor-EntriesList</i> | List of <a href="#">OOLUA_CTOR</a> |
|--------------------------------|------------------------------------|

To enable the construction of an instance which is a specific type, there must be constructor(s) for that type registered with OOLua. [OOLUA\\_CTORS](#) is the block into which you can define none default constructor entries using [OOLUA\\_CTOR](#).

Constructors are the only real type of overloading which is permitted by OOLua and there is an important point which should be noted. OOLua will try and match the number of parameters on the stack with the amount required by each [OOLUA\\_CTOR](#) entry and will look in the order they were defined. When interacting with the Lua stack certain types can not be differentiated between, these include some integral types such as float, int, double etc and types which are of a proxy class type or derived from that type. OOLua implicitly converts between classes in a hierarchy even if a reference is required. This means for example that if there are constructors such as `Foo::Foo(int)` and `Foo::Foo(float)` it will depend on which was defined first in the [OOLUA\\_CTORS](#) block as to which will be invoked for a call such as `Foo.new(1)`.

See Also

[No\\_default\\_constructor](#)

Note

An [OOLUA\\_CTORS](#) block without any [OOLUA\\_CTOR](#) entries is invalid.

#### 13.4.2.3 #define OOLUA\_ENUM( EnumName )

Creates a entry into a [OOLUA\\_ENUMS](#) block.

[OOLUA\\_ENUM\(EnumName\)](#)

## Parameters

|                 |                            |
|-----------------|----------------------------|
| <i>EnumName</i> | The class enumeration name |
|-----------------|----------------------------|

13.4.2.4 `#define OOLUA_ENUMS( EnumEntriesList )`

Creates a block into which enumerators can be defined with [OOLUA\\_ENUM](#).

[OOLUA\\_ENUMS\(EnumEntriesList\)](#)

## Parameters

|                        |                                    |
|------------------------|------------------------------------|
| <i>EnumEntriesList</i> | List of <a href="#">OOLUA_ENUM</a> |
|------------------------|------------------------------------|

## Note

An `OOLUA_ENUMS` block without any [OOLUA\\_ENUM](#) entries is invalid.

13.4.2.5 `#define OOLUA_MGET( ... )`

Generates a getter, which is a constant function, to retrieve a public instance.

[OOLUA\\_MGET\(PublicName, Optional\)](#)

## Parameters

|                   |   |
|-------------------|---|
| <i>PublicName</i> | Name of the public variable to be proxied.          |
| <i>Optional</i>   | GetterName. Defaults to <code>get_PublicName</code> |

13.4.2.6 `#define OOLUA_MGET_MSET( ... )`

Generates a getter and setter for a public instance.

[OOLUA\\_MGET\\_MSET\(PublicName, Optional1, Optional2\)](#)

## Parameters

|                   |   |
|-------------------|---|
| <i>PublicName</i> | Name of the public variable to be proxied.          |
| <i>Optional1</i>  | GetterName. Defaults to <code>get_PublicName</code> |
| <i>Optional2</i>  | SetterName. Defaults to <code>set_PublicName</code> |

## See Also

[OOLUA\\_MGET](#) and [OOLUA\\_MSET](#)

## Note

If one optional parameter is supplied then both must be given.

13.4.2.7 `#define OOLUA_MSET( ... )`

Generates a setter, which is a none constant function, to set the public instance.

[OOLUA\\_MSET\(PublicName, Optional\)](#)

## Parameters

|                   |  |
|-------------------|--|
| <i>PublicName</i> | Name of the public variable to be proxied. |
| <i>Optional</i>   | SetterName. Defaults to set_PublicName     |

## 13.4.2.8 #define OOLUA\_PROXY( ... )

Starts the generation a proxy class.

[OOLUA\\_PROXY\(ClassName, Optional\)](#)

## Parameters

|                  |   |
|------------------|---|
| <i>ClassName</i> | Class to be proxied                       |
| <i>Optional</i>  | Comma seperated list of real base classes |

## Precondition

Each class specified in Optional must be a real base class of ClassName

## 13.4.2.9 #define OOLUA\_TAGS( ... )

Allows more information to be specified about the proxy class.

Tags specifiy more information about the class which should be exposed, such as:

- Does the class support any operators?
- Is it abstract ?
- Does the class have enumerations?

[OOLUA\\_TAGS\(TagList\)](#)

## Parameters

|                |  |
|----------------|--|
| <i>TagList</i> | Comma seperated list of <a href="#">Tags</a> |
|----------------|--|

## Note

An OOLUA\_TAGS list without any [Tags](#) entries is invalid.

## 13.5 Expressive

Generates code where all details are expressed.

### Macros

- `#define OOLUA_MEM_FUNC(...)`  
*Generates a member function proxy which will also be the named `FunctionName`.*
- `#define OOLUA_MEM_FUNC_RENAME(...)`  
*Generates a member function proxy which will be the named `ProxyFunctionName`.*
- `#define OOLUA_MEM_FUNC_CONST(...)`  
*Generates a constant member function proxy which will also be the named `FunctionName`.*
- `#define OOLUA_MEM_FUNC_CONST_RENAME(...)`  
*Generates a constant member function which will be named `ProxyFunctionName`.*
- `#define OOLUA_C_FUNCTION(...)`  
*Generates a block which will call the C function `FunctionName`.*

### 13.5.1 Detailed Description

Generates code where all details are expressed. Generates a function for which the user has expressed all the parameters for a function these may additionally have [Traits](#).

### 13.5.2 Macro Definition Documentation

#### 13.5.2.1 `#define OOLUA_C_FUNCTION( ... )`

Generates a block which will call the C function `FunctionName`.

`OOLUA_C_FUNCTION(FunctionReturnType,FunctionName, Optional)`

#### Parameters

|                            |  |
|----------------------------|--|
| <i>FunctionReturn-Type</i> |  |
| <i>FunctionName</i>        |  |
| <i>Optional</i>            | Comma seperated list of function parameter types |

#### See Also

[cpp\\_params](#)

#### Precondition

The function in which this macro is contained must declare a `lua_State` pointer which can be identified by the name "vm"

```
extern void foo(int);
int l_foo(lua_State* vm)
{
    OOLUA_C_FUNCTION(void, foo, int)
}
```

#### Note

This macro should ideally be used as the last operation of a function body as control will return to the caller. Notice there is no return statement in `l_foo`

13.5.2.2 `#define OOLUA_MEM_FUNC( ... )`

Generates a member function proxy which will also be the named `FunctionName`.

`OOLUA_MEM_FUNC( FunctionReturnType, FunctionName, Optional)`

## Parameters

|                            |  |
|----------------------------|--|
| <i>FunctionReturn-Type</i> |  |
| <i>FunctionName</i>        |  |
| <i>Optional</i>            | : Comma seperated list of function parameter types |

## See Also

[cpp\\_params](#)

13.5.2.3 `#define OOLUA_MEM_FUNC_CONST( ... )`

Generates a constant member function proxy which will also be the named `FunctionName`.

`OOLUA_MEM_FUNC_CONST( FunctionReturnType,FunctionName,Optional)`

## Parameters

|                            |  |
|----------------------------|--|
| <i>FunctionReturn-Type</i> |  |
| <i>FunctionName</i>        |  |
| <i>Optional</i>            | Comma seperated list of function parameter types |

## See Also

[cpp\\_params](#)

13.5.2.4 `#define OOLUA_MEM_FUNC_CONST_RENAME( ... )`

Generates a constant member function which will be named `ProxyFunctionName`.

`OOLUA_MEM_FUNC_CONST_RENAME( ProxyFunctionName, FunctionReturnType, FunctionName,Optional)`

## Parameters

|                            |  |
|----------------------------|--|
| <i>ProxyFunction-Name</i>  |  |
| <i>FunctionReturn-Type</i> |  |
| <i>FunctionName</i>        |  |
| <i>Optional</i>            | Comma seperated list of function parameter types |

## See Also

[cpp\\_params](#)

13.5.2.5 `#define OOLUA_MEM_FUNC_RENAME( ... )`

Generates a member function proxy which will be the named `ProxyFunctionName`.

`OOLUA_MEM_FUNC_RENAME( ProxyFunctionName, FunctionReturnType,FunctionName, Optional)`

## Parameters

|                            |  |
|----------------------------|--|
| <i>ProxyFunction-Name</i>  |  |
| <i>FunctionReturn-Type</i> |  |
| <i>FunctionName</i>        |  |
| <i>Optional</i>            | : Comma seperated list of function parameter types |

## See Also

[cpp\\_params](#)

## 13.6 Minimalist

Generates code using the minimal information.

### Macros

- `#define OOLUA_MFUNC(...)`  
*Deduce and generate a proxy for a member function.*
- `#define OOLUA_MFUNC_CONST(...)`  
*Deduce and generate a proxy for a constant member function.*
- `#define OOLUA_CFUNC(...)`  
*Deduce and generate a proxy for a C function.*
- `#define OOLUA_SFUNC(...)`  
*Deduce and generate a proxy for a class static function.*

### 13.6.1 Detailed Description

Generates code using the minimal information. Generates a proxy function using the only the minimal of information which is generally the name of the thing being proxied and possibly a new name for the proxy. As with taking the address of any C++ function, if there is any ambiguity it will fail to compile, in which case a user should help the compiler by specifying more information using the matching, yet longer named [Expressive](#) DSL entry.

The longer DSL name requires more information.

#### Note

No [Traits](#) can be expressed with this DSL group.

### 13.6.2 Macro Definition Documentation

#### 13.6.2.1 `#define OOLUA_CFUNC( ... )`

Deduce and generate a proxy for a C function.

[OOLUA\\_CFUNC\(FunctionName, ProxyFunctionName\)](#)

#### Parameters

|                           |  |
|---------------------------|--|
| <i>FunctionName</i>       | Name of the C function to be proxied                           |
| <i>ProxyFunction-Name</i> | Name of the function to generate which will proxy FunctionName |

#### See Also

[cpp\\_params](#)  
[OOLUA\\_C\\_FUNCTION](#)

#### 13.6.2.2 `#define OOLUA_MFUNC( ... )`

Deduce and generate a proxy for a member function.

[OOLUA\\_MFUNC\(FunctionName, Optional\)](#)

## Parameters

|                     |   |
|---------------------|---|
| <i>FunctionName</i> | Name of the member function to be proxied   |
| <i>Optional</i>     | ProxyFunctionName. Defaults to FunctionName |

## See Also

[cpp\\_params](#)  
[OOLUA\\_MEM\\_FUNC](#)  
[OOLUA\\_MEM\\_FUNC\\_RENAME](#)

## 13.6.2.3 #define OOLUA\_MFUNC\_CONST( ... )

Deduce and generate a proxy for a constant member function.

[OOLUA\\_MFUNC\\_CONST\(FunctionName, Optional\)](#)

## Parameters

|                     |   |
|---------------------|---|
| <i>FunctionName</i> | Name of the constant function to be proxied |
| <i>Optional</i>     | ProxyFunctionName. Defaults to FunctionName |

## See Also

[cpp\\_params](#)  
[OOLUA\\_MEM\\_FUNC\\_CONST](#)  
[OOLUA\\_MEM\\_FUNC\\_CONST\\_RENAME](#)

## 13.6.2.4 #define OOLUA\_SFUNC( ... )

Deduce and generate a proxy for a class static function.

[OOLUA\\_SFUNC\(FunctionName, Optional\)](#)

## Parameters

|                     |   |
|---------------------|---|
| <i>FunctionName</i> | Name of the static function to be proxied   |
| <i>Optional</i>     | ProxyFunctionName. Defaults to FunctionName |

## Note

This function will not be exported and needs to be registered with OOLua see [OOLUA::register\\_class\\_static](#)

## See Also

[cpp\\_params](#)

## 13.7 Exporting

Exports member functions.

### Macros

- `#define OOLUA_EXPORT_FUNCTIONS(...)`  
*Exports zero or more member functions which will be registered with Lua.*
- `#define OOLUA_EXPORT_FUNCTIONS_CONST(...)`  
*Exports zero or more const member functions which will be registered with Lua.*
- `#define OOLUA_EXPORT_NO_FUNCTIONS(Class)`  
*Inform that there are no functions of interest.*

### 13.7.1 Detailed Description

Exports member functions. Exporting defines which member functions will be registered with Lua when the class type is registered. Even when there are no member functions to be exported you still need to inform OOLua about this. Calling an `OOLUA_EXPORT*` procedure in a header file is an error that will fail to compile.

#### See Also

[OOLUA\\_EXPORT\\_FUNCTIONS](#)  
[OOLUA\\_EXPORT\\_FUNCTIONS\\_CONST](#)  
[OOLUA\\_EXPORT\\_NO\\_FUNCTIONS](#)

### 13.7.2 Macro Definition Documentation

#### 13.7.2.1 `#define OOLUA_EXPORT_FUNCTIONS( ... )`

Exports zero or more member functions which will be registered with Lua.

`OOLUA_EXPORT_FUNCTIONS(ClassName,Optional)`

##### Parameters

|                  |   |
|------------------|---|
| <i>ClassName</i> | Name of class to which the function belong to |
| <i>Optional</i>  | Comma seperated list of member function names |

#### See Also

[class\\_functions](#)

#### 13.7.2.2 `#define OOLUA_EXPORT_FUNCTIONS_CONST( ... )`

Exports zero or more const member functions which will be registered with Lua.

`OOLUA_EXPORT_FUNCTIONS_CONST(ClassName,Optional)`

##### Parameters

|                  |   |
|------------------|---|
| <i>ClassName</i> | Name of class to which the function belong to |
|------------------|---|

|                 |  |
|-----------------|--|
| <i>Optional</i> | Comma seperated list of constant member function names |
|-----------------|--|

**See Also**[class\\_functions](#)**13.7.2.3 #define OOLUA\_EXPORT\_NO\_FUNCTIONS( *Class* )****Value:**

```
EXPORT_OOLUA_FUNCTIONS_0_NON_CONST(Class) \  
EXPORT_OOLUA_FUNCTIONS_0_CONST(Class)
```

Inform that there are no functions of interest.

**Parameters**

|              |  |
|--------------|--|
| <i>Class</i> |  |
|--------------|--|

## 13.8 Error Reporting

Defines how any errors are reported.

### Modules

- [Exception classes](#)

### Macros

- `#define OOLUA_USE_EXCEPTIONS`  
*Default: Disabled*
- `#define OOLUA_STORE_LAST_ERROR`  
*Default: Enabled*

### Functions

- `void OOLUA::reset_error_value (lua_State *vm)`  
*Reset the error state such that a call to [OOLUA::get\\_last\\_error](#) will return an empty string.*
- `std::string OOLUA::get_last_error (lua_State *vm)`  
*Returns the last stored error.*

#### 13.8.1 Detailed Description

Defines how any errors are reported. Errors can be reported either by using exceptions or storing a retrievable error string, only one of these methods is allowed and this condition is enforced, yet also neither are required. If both are disabled then it depends on [OOLUA\\_DEBUG\\_CHECKS](#) as to whether any error will be reported

#### 13.8.2 Macro Definition Documentation

##### 13.8.2.1 `#define OOLUA_STORE_LAST_ERROR`

**Default:** Enabled

Stores an error message in the registry overwriting any previous error, the last error to have occurred is retrievable via [OOLUA::get\\_last\\_error](#)

See Also

[OOLUA::get\\_last\\_error](#)  
[OOLUA::reset\\_error\\_value](#)

Parameters

|   |          |
|---|----------|
| 0 | Disabled |
| 1 | Enabled  |

##### 13.8.2.2 `#define OOLUA_USE_EXCEPTIONS`

**Default:** Disabled

Throws exceptions from C++ code. This could be the return of a pcall, or from pulling an incorrect type off the stack when [OOLUA\\_RUNTIME\\_CHECKS\\_ENABLED](#) is enabled. It also prevents exceptions escaping from function proxied by the library, enabling calls to such functions to be caught with pcall in Lua code.

## Parameters

|   |          |
|---|----------|
| 0 | Disabled |
| 1 | Enabled  |

### 13.8.3 Function Documentation

#### 13.8.3.1 `std::string OOLUA::get_last_error ( lua_State * vm )`

Returns the last stored error.

## Returns

empty string if there is not an error else the error message

## See Also

[Error Reporting](#)

## Note

This function is a nop when [OOLUA\\_STORE\\_LAST\\_ERROR](#) is not enabled

#### 13.8.3.2 `void OOLUA::reset_error_value ( lua_State * vm )`

Reset the error state such that a call to [OOLUA::get\\_last\\_error](#) will return an empty string.

## See Also

[Error Reporting](#)

## Note

This function is a nop when [OOLUA\\_STORE\\_LAST\\_ERROR](#) is not enabled

## 13.9 Error Checking

Defines the type of checks which will be performed.

### Macros

- `#define OOLUA_RUNTIME_CHECKS_ENABLED`  
*Default: Enabled*
- `#define OOLUA_CHECK_EVERY_USERDATA_IS_CREATED_BY_OOLUA`  
*Default: Enabled*
- `#define OOLUA_USERDATA_OPTIMISATION`  
*Default: Enabled*
- `#define OOLUA_DEBUG_CHECKS`  
*Default: Enabled when `DEBUG` or `_DEBUG` is defined*
- `#define OOLUA_SANDBOX`  
*Default: Disabled*

### 13.9.1 Detailed Description

Defines the type of checks which will be performed.

### 13.9.2 Macro Definition Documentation

#### 13.9.2.1 `#define OOLUA_CHECK_EVERY_USERDATA_IS_CREATED_BY_OOLUA`

**Default:** Enabled

Does what it says on the tin, only valid when `OOLUA_RUNTIME_CHECKS_ENABLED` is enabled

Parameters

|   |          |
|---|----------|
| 0 | Disabled |
| 1 | Enabled  |

#### 13.9.2.2 `#define OOLUA_DEBUG_CHECKS`

**Default:** Enabled when `DEBUG` or `_DEBUG` is defined

- Adds Checks for NULL pointers
- Adds a stack trace to errors reported by `pcall`
- Calls `assert` on errors if both `OOLUA_USE_EXCEPTIONS` and `OOLUA_STORE_LAST_ERROR` are both disabled

Parameters

|   |          |
|---|----------|
| 0 | Disabled |
| 1 | Enabled  |

#### 13.9.2.3 `#define OOLUA_RUNTIME_CHECKS_ENABLED`

**Default:** Enabled

Checks that a type being pulled off the stack is of the correct type, if this is a proxy type, it also checks the userdata on the stack was created by OOLua

**Parameters**

|   |          |
|---|----------|
| 0 | Disabled |
| 1 | Enabled  |

**13.9.2.4 #define OOLUA\_SANDBOX****Default:** Disabled

check everything

**Parameters**

|   |          |
|---|----------|
| 0 | Disabled |
| 1 | Enabled  |

**13.9.2.5 #define OOLUA\_USERDATA\_OPTIMISATION****Default:** Enabled

Userdata optimisation which checks for a magic cookie to try and ensure it was created by OOLua, by default this is on when userdata checking is on. Turning this off by setting it to zero will use a slower yet correct (as correct as can be) method.

Only meaningful when [OOLUA\\_CHECK EVERY USERDATA IS CREATED BY OOLUA](#) is enabled

**Parameters**

|   |          |
|---|----------|
| 0 | Disabled |
| 1 | Enabled  |

## 13.10 Exception classes

### Classes

- struct [OOLUA::Exception](#)  
*Base class for OOLua exceptions.*
- struct [OOLUA::Syntax\\_error](#)  
*Reports LUA\_ERRSYNTAX.*
- struct [OOLUA::Runtime\\_error](#)  
*Reports LUA\_ERRRUN.*
- struct [OOLUA::Memory\\_error](#)  
*Reports LUA\_ERRMEM.*
- struct [OOLUA::File\\_error](#)  
*Reports LUA\_ERRFILE.*
- struct [OOLUA::Type\\_error](#)  
*Reports that a type pulled from the stack was not the type that was asked for.*

### 13.10.1 Detailed Description

## 13.11 Traits

Provides direction and/or ownership information.

### Modules

- [Parameter Traits](#)  
*DSL Traits for function parameter types.*
- [Function Return Traits](#)  
*DSL traits for function return types.*
- [Stack Traits](#)  
*Public API traits which control a change of ownership.*

### 13.11.1 Detailed Description

Provides direction and/or ownership information. The general naming convention for traits is:

- [Parameter Traits](#) : end in "\_p"
- [Function Return Traits](#) : end in "\_return" or "\_null"
- [Stack Traits](#) : end in "\_ptr".

## 13.12 Parameter Traits

DSL Traits for function parameter types.

### Classes

- struct `OOLUA::in_p< T >`  
*Input parameter trait.*
- struct `OOLUA::out_p< T >`  
*Output parameter trait.*
- struct `OOLUA::in_out_p< T >`  
*Input and output parameter trait.*
- struct `OOLUA::cpp_in_p< T >`  
*Input parameter trait which will be owned by C++.*
- struct `OOLUA::lua_out_p< T >`  
*Output parameter trait which will be owned by Lua.*
- struct `OOLUA::light_p< T >`  
*Input parameter trait.*
- struct `OOLUA::calling_lua_state`  
*Special parameter type.*

### 13.12.1 Detailed Description

DSL Traits for function parameter types. Traits which allow control of ownership include in their name either "lua" or "cpp"; directional traits contain "in", "out" or a combination.

## 13.13 Function Return Traits

DSL traits for function return types.

### Classes

- struct `OOLUA::light_return< T >`  
*Return trait for a light userdata type.*
- struct `OOLUA::lua_return< T >`  
*Return trait for a type which will be owned by Lua.*
- struct `OOLUA::maybe_null< T >`  
*Return trait for a pointer which at runtime maybe NULL.*
- struct `OOLUA::lua_maybe_null< T >`  
*Return trait for a pointer which at runtime maybe NULL and also allowing transfer of ownership.*

### 13.13.1 Detailed Description

DSL traits for function return types. Some of the these traits allow for NULL pointers to be returned from functions, which was something commonly requested for the library. When such a trait is used and the runtime value is NULL, Lua's value of nil will be pushed to the stack.

## 13.14 Stack Traits

Public API traits which control a change of ownership.

### Classes

- struct `OOLUA::cpp_acquire_ptr< T >`  
*Change of ownership to C++.*
- struct `OOLUA::lua_acquire_ptr< T >`  
*Change of ownership to Lua.*

### 13.14.1 Detailed Description

Public API traits which control a change of ownership. Valid to usage for the Public API which interact with the Lua stack.

## 13.15 Tags

Possible members for `OOLUA_TAGS` which help express more information about a class which is to be proxied.

### Modules

- `Operator Tags`

*Informs that a class has an operator exposed.*

### Namespaces

- `OOLUA`

*This is the root namespace of the Library.*

### Classes

- struct `OOLUA::Abstract`

*The class being mirrored is an abstract class.*

- struct `OOLUA::No_default_constructor`

*There is not a default constructor in the public interface yet there are other constructors.*

- struct `OOLUA::No_public_constructors`

*There are no constructors in the public interface.*

- struct `OOLUA::No_public_destructor`

*There is not a destructor in the public interface and OOLua will not attempt to delete an instance of this type.*

- struct `OOLUA::Register_class_enums`

*The class has enums to register.*

### 13.15.1 Detailed Description

Possible members for `OOLUA_TAGS` which help express more information about a class which is to be proxied.

## 13.16 Operator Tags

Informs that a class has an operator exposed.

### Classes

- struct [OOLUA::Less\\_op](#)  
*Less than operator is defined for the type.*
- struct [OOLUA::Equal\\_op](#)  
*Equal operator is defined for the type.*
- struct [OOLUA::Not\\_equal\\_op](#)  
*Not equal operator is defined for the type.*
- struct [OOLUA::Less\\_equal\\_op](#)  
*Less than or equal operator is defined for the type.*
- struct [OOLUA::Div\\_op](#)  
*Division operator is defined for the type.*
- struct [OOLUA::Mul\\_op](#)  
*Multiplication operator is defined for the type.*
- struct [OOLUA::Sub\\_op](#)  
*Subtraction operator is defined for the type.*
- struct [OOLUA::Add\\_op](#)  
*Addition operator is defined for the type.*

### 13.16.1 Detailed Description

Informs that a class has an operator exposed. [Operator Tags](#) inform OOLua that a class exposes one or more of the operators supported:

- [Less\\_op](#)
- [Equal\\_op](#)
- [Not\\_equal\\_op](#)
- [Less\\_equal\\_op](#)
- [Div\\_op](#)
- [Mul\\_op](#)
- [Sub\\_op](#)
- [Add\\_op](#)

# Chapter 14

## Namespace Documentation

### 14.1 OOLUA Namespace Reference

This is the root namespace of the Library.

#### Namespaces

- [STRING](#)

*Defines which type of string classes can be pulled and pushed from the stack with the public API and the DSL.*

#### Classes

- struct [Lua\\_function](#)  
*Structure which is used to call a Lua function.*
- class [Proxy\\_class](#)  
*A template wrapper for class objects of type T used by the script binding.*
- struct [Lua\\_ref](#)  
*A typed wrapper for a Lua reference.*
- class [Script](#)  
*OOLua helper class.*
- class [Table](#)  
*Wrapper around a table in Lua which allows easy usage.*
- struct [in\\_p](#)  
*Input parameter trait.*
- struct [out\\_p](#)  
*Output parameter trait.*
- struct [in\\_out\\_p](#)  
*Input and output parameter trait.*
- struct [cpp\\_in\\_p](#)  
*Input parameter trait which will be owned by C++.*
- struct [lua\\_out\\_p](#)  
*Output parameter trait which will be owned by Lua.*
- struct [light\\_p](#)  
*Input parameter trait.*
- struct [light\\_return](#)  
*Return trait for a light userdata type.*
- struct [lua\\_return](#)

- Return trait for a type which will be owned by Lua.*

  - struct [maybe\\_null](#)
- Return trait for a pointer which at runtime maybe NULL.*

  - struct [lua\\_maybe\\_null](#)
- Return trait for a pointer which at runtime maybe NULL and also allowing transfer of ownership.*

  - struct [cpp\\_acquire\\_ptr](#)
- Change of ownership to C++.*

  - struct [lua\\_acquire\\_ptr](#)
- Change of ownership to Lua.*

  - struct [calling\\_lua\\_state](#)
- Special parameter type.*

  - struct [in\\_p< char \\* >](#)
- Specialisation for C style strings.*

  - struct [Abstract](#)
- The class being mirrored is an abstract class.*

  - struct [Less\\_op](#)
- Less than operator is defined for the type.*

  - struct [Equal\\_op](#)
- Equal operator is defined for the type.*

  - struct [Not\\_equal\\_op](#)
- Not equal operator is defined for the type.*

  - struct [Less\\_equal\\_op](#)
- Less than or equal operator is defined for the type.*

  - struct [Div\\_op](#)
- Division operator is defined for the type.*

  - struct [Mul\\_op](#)
- Multiplication operator is defined for the type.*

  - struct [Sub\\_op](#)
- Subtraction operator is defined for the type.*

  - struct [Add\\_op](#)
- Addition operator is defined for the type.*

  - struct [No\\_default\\_constructor](#)
- There is not a default constructor in the public interface yet there are other constructors.*

  - struct [No\\_public\\_constructors](#)
- There are no constructors in the public interface.*

  - struct [No\\_public\\_destructor](#)
- There is not a destructor in the public interface and OOLua will not attempt to delete an instance of this type.*

  - struct [Register\\_class\\_enums](#)
- The class has enums to register.*

  - struct [Exception](#)
- Base class for OOLua exceptions.*

  - struct [Syntax\\_error](#)
- Reports LUA\_ERRSYNTAX.*

  - struct [Runtime\\_error](#)
- Reports LUA\_ERRRUN.*

  - struct [Memory\\_error](#)
- Reports LUA\_ERRMEM.*

  - struct [File\\_error](#)
- Reports LUA\_ERRFILE.*

  - struct [Type\\_error](#)
- Reports that a type pulled from the stack was not the type that was asked for.*

## Typedefs

- typedef [Lua\\_ref](#)< [LUA\\_TTABLE](#) > [Lua\\_table\\_ref](#)  
*Typedef helper for a [LUA\\_TTABLE](#) registry reference.*
- typedef [Lua\\_ref](#)< [LUA\\_TFUNCTION](#) > [Lua\\_func\\_ref](#)  
*Typedef helper for a [LUA\\_TFUNCTION](#) registry reference.*

## Enumerations

- enum [Owner](#) { [No\\_change](#), [Cpp](#), [Lua](#) }

## Functions

- template<typename T >  
bool [set\\_global](#) ([lua\\_State](#) \*vm, char const \*name, T &instance)  
*Helper function to set a Lua global variable.*
- bool [set\\_global](#) ([lua\\_State](#) \*vm, char const \*name, [lua\\_CFunction](#) instance)  
*None template version.*
- void [set\\_global\\_to\\_nil](#) ([lua\\_State](#) \*vm, char const \*name)  
*Helper function to set a Lua global variable to nil.*
- template<typename T >  
bool [get\\_global](#) ([lua\\_State](#) \*vm, char const \*name, T &instance)  
*Helper function to set a Lua global variable.*
- bool [load\\_chunk](#) ([lua\\_State](#) \*vm, std::string const &chunk)  
*Loads a chunk leaving the resulting function on the stack.*
- bool [run\\_chunk](#) ([lua\\_State](#) \*vm, std::string const &chunk)  
*Loads and runs a chunk of code.*
- bool [load\\_file](#) ([lua\\_State](#) \*vm, std::string const &filename)  
*Loads a file leaving the resulting function on the stack.*
- bool [run\\_file](#) ([lua\\_State](#) \*vm, std::string const &filename)  
*Loads and runs the file.*
- void [reset\\_error\\_value](#) ([lua\\_State](#) \*vm)  
*Reset the error state such that a call to [OOLUA::get\\_last\\_error](#) will return an empty string.*
- std::string [get\\_last\\_error](#) ([lua\\_State](#) \*vm)  
*Returns the last stored error.*
- bool [idxs\\_equal](#) ([lua\\_State](#) \*vm, int idx0, int idx1)
- bool [can\\_xmove](#) ([lua\\_State](#) \*vm0, [lua\\_State](#) \*vm1)  
*Uses the Lua C API to check if it is valid to move data between the states.*
- void [setup\\_user\\_lua\\_state](#) ([lua\\_State](#) \*vm)  
*Sets up a [lua\\_State](#) to work with OOLua.*
- template<typename T >  
void [register\\_class](#) ([lua\\_State](#) \*vm)  
*Registers the class type T and it's bases with an instance of [lua\\_State](#).*
- template<typename T, typename K, typename V >  
void [register\\_class\\_static](#) ([lua\\_State](#) \*const vm, K const &k, V const &v)  
*Registers a key K and value V entry into class T.*
- template<typename T, typename T1 >  
void [table\\_set\\_value](#) ([lua\\_State](#) \*vm, int table\_index, T const &key, T1 const &value)  
*The table is at table\_index which can be either absolute or pseudo in the stack table is left at the index.*
- template<typename T, typename T1 >  
bool [table\\_at](#) ([lua\\_State](#) \*vm, int const table\_index, T const &key, T1 &value)

The table is at `table_index` which can be either absolute or pseudo in the stack table is left at the index.

- void `new_table` (`lua_State *vm`, `OOLUA::Table &t`)  
Creates a new valid `OOLUA::Table`.
- `OOLUA::Table new_table` (`lua_State *vm`)  
Creates a new valid `Table`.
  
- template<typename T >  
bool `pull` (`lua_State *const vm`, T &value)  
Pulls the top element off the stack and pops it.
- template<typename T >  
bool `pull` (`lua_State *const vm`, `OOLUA::cpp_acquire_ptr< T > &value`)  
Pulls the top element off the stack and pops it.
- template<typename T >  
bool `pull` (`lua_State *const vm`, T \*&value)  
Pulls the top element off the stack and pops it.
- bool `pull` (`lua_State *const vm`, void \*&lightud)  
Pulls the top element off the stack and pops it.
- bool `pull` (`lua_State *const vm`, bool &value)  
Pulls the top element off the stack and pops it.
- bool `pull` (`lua_State *const vm`, double &value)  
Pulls the top element off the stack and pops it.
- bool `pull` (`lua_State *const vm`, float &value)  
Pulls the top element off the stack and pops it.
- bool `pull` (`lua_State *const vm`, `oolua_CFunction` &value)  
Pulls the top element off the stack and pops it.
- bool `pull` (`lua_State *const vm`, `Table` &value)  
Pulls the top element off the stack and pops it.
  
- template<typename T >  
bool `push` (`lua_State *const vm`, T const &value)  
Pushes an instance to top of the Lua stack.
- template<typename T >  
bool `push` (`lua_State *const vm`, `OOLUA::lua_acquire_ptr< T > &value`)  
Pushes an instance to top of the Lua stack.
- template<typename T >  
bool `push` (`lua_State *const vm`, T \*const &value)  
Pushes an instance to top of the Lua stack.
- bool `push` (`lua_State *const vm`, void \*lightud)  
Pushes an instance to top of the Lua stack.
- bool `push` (`lua_State *const vm`, bool const &value)  
Pushes an instance to top of the Lua stack.
- bool `push` (`lua_State *const vm`, char \*const &value)  
Pushes an instance to top of the Lua stack.
- bool `push` (`lua_State *const vm`, char const \*const &value)  
Pushes an instance to top of the Lua stack.
- bool `push` (`lua_State *const vm`, double const &value)  
Pushes an instance to top of the Lua stack.
- bool `push` (`lua_State *const vm`, float const &value)  
Pushes an instance to top of the Lua stack.
- bool `push` (`lua_State *const vm`, `oolua_CFunction` const &value)  
Pushes an instance to top of the Lua stack.
- bool `push` (`lua_State *const vm`, `Table` const &value)  
Pushes an instance to top of the Lua stack.

## Variables

- static const char [version\\_str](#) [] = OOLUA\_STRINGISE(OOLUA\_VERSION\_MAJ) "." OOLUA\_STRINGISE(OOLUA\_VERSION\_MIN) "." OOLUA\_STRINGISE(OOLUA\_VERSION\_PATCH) " Beta 3"  
*OOLua version string.*
- static const int [version\\_number](#) = 2\*10000+0\*1000+0  
*OOLua version int.*

### 14.1.1 Detailed Description

This is the root namespace of the Library. There are sub namespaces contained in [OOLUA](#) yet mostly these are not meant for general usage, instead this namespace contains all Public API functions, structures etc.

### 14.1.2 Enumeration Type Documentation

#### 14.1.2.1 enum OOLUA::Owner

##### Enumerator

- No\_change** No change of ownership
- Cpp** Change in ownership, C++ will now own the instance
- Lua** Change in ownership, Lua will now own the instance

### 14.1.3 Function Documentation

#### 14.1.3.1 bool OOLUA::can\_xmove ( lua\_State \* vm0, lua\_State \* vm1 )

Uses the Lua C API to check if it is valid to move data between the states.

lua\_xmove returns without doing any work if the two pointers are the same and fails when using LUA\_USE\_APICHECK and the states do not share the same global\_State.

It may be fine to move numbers between different unrelated states when Lua was not compiled with LUA\_USE\_APICHECK but this function would still return false for that scenario.

##### Parameters

|    |            |  |
|----|------------|--|
| in | <i>vm0</i> |  |
| in | <i>vm1</i> |  |

##### Returns

true is vm0 and vm1 are different yet none NULL related states, else false

#### 14.1.3.2 template<typename T> bool OOLUA::get\_global ( lua\_State \* vm, char const \* name, T & instance )

Helper function to set a Lua global variable.

##### Template Parameters

|          |                   |
|----------|-------------------|
| <i>T</i> | Type for instance |
|----------|-------------------|

**Parameters**

|     |                 |  |
|-----|-----------------|--|
| in  | <i>vm</i>       | <a href="#">lua_State</a>                          |
| in  | <i>name</i>     | Global name to query                               |
| out | <i>instance</i> | Any variable which is valid to pull from the stack |

**Returns**

Boolean indicating if the operation was successful

**See Also**

[Error Reporting](#)

**14.1.3.3 bool OOLUA::idxs\_equal ( lua\_State \* vm, int idx0, int idx1 )**

Compares two valid indices on the stack of vm.

This takes into consideration metamethods for the indices

**Parameters**

|    |             |  |
|----|-------------|--|
| in | <i>vm</i>   | The <a href="#">lua_State</a> in which to prefer the operation |
| in | <i>idx0</i> | Valid stack index  |
| in | <i>idx1</i> | Valid stack index  |

**Returns**

boolean Result of the comparison

**14.1.3.4 bool OOLUA::load\_chunk ( lua\_State \* vm, std::string const & chunk )**

Loads a chunk leaving the resulting function on the stack.

**Parameters**

|    |              |   |
|----|--------------|---|
| in | <i>vm</i>    | Lua virtual machine. Taken from Lua manual : An opaque structure that points to a thread and indirectly (through the thread) to the whole state of a Lua interpreter. The Lua library is fully reentrant: it has no global variables. All information about a state is accessible through this structure. |
| in | <i>chunk</i> |   |

**14.1.3.5 bool OOLUA::load\_file ( lua\_State \* vm, std::string const & filename )**

Loads a file leaving the resulting function on the stack.

**Parameters**

|    |           |   |
|----|-----------|---|
| in | <i>vm</i> | Lua virtual machine. Taken from Lua manual : An opaque structure that points to a thread and indirectly (through the thread) to the whole state of a Lua interpreter. The Lua library is fully reentrant: it has no global variables. All information about a state is accessible through this structure. |
|----|-----------|---|

|           |                 |  |
|-----------|-----------------|--|
| <i>in</i> | <i>filename</i> |  |
|-----------|-----------------|--|

14.1.3.6 void OOLUA::new\_table ( lua\_State \* *vm*, OOLUA::Table & *t* )

Creates a new valid [OOLUA::Table](#).

Parameters

|                |           |  |
|----------------|-----------|--|
| <i>in</i>      | <i>vm</i> |  |
| <i>in, out</i> | <i>t</i>  |  |

Postcondition

stack is the same on exit as entry

14.1.3.7 OOLUA::Table OOLUA::new\_table ( lua\_State \* *vm* )

Creates a new valid [Table](#).

Postcondition

stack is the same on exit as entry

14.1.3.8 bool OOLUA::pull ( lua\_State \*const *vm*, void \*& *lightud* )

Pulls the top element off the stack and pops it.

In stack terms this is a top followed by pop.

Returns

If [OOLUA\\_STORE\\_LAST\\_ERROR](#) is set to one then the return value will indicate success or failure, if [OOLUA\\_USE\\_EXCEPTIONS](#) is set to one then failure will always be reported by throwing an exception.

See Also

[Error Reporting](#)  
[Exception classes](#)

14.1.3.9 bool OOLUA::pull ( lua\_State \*const *vm*, bool & *value* )

Pulls the top element off the stack and pops it.

In stack terms this is a top followed by pop.

Returns

If [OOLUA\\_STORE\\_LAST\\_ERROR](#) is set to one then the return value will indicate success or failure, if [OOLUA\\_USE\\_EXCEPTIONS](#) is set to one then failure will always be reported by throwing an exception.

See Also

[Error Reporting](#)  
[Exception classes](#)

#### 14.1.3.10 `bool OOLUA::pull ( lua_State *const vm, double & value )`

Pulls the top element off the stack and pops it.

In stack terms this is a top followed by pop.

##### Returns

If [OOLUA\\_STORE\\_LAST\\_ERROR](#) is set to one then the return value will indicate success or failure, if [OOLUA\\_USE\\_EXCEPTIONS](#) is set to one then failure will always be reported by throwing an exception.

##### See Also

[Error Reporting](#)  
[Exception classes](#)

#### 14.1.3.11 `bool OOLUA::pull ( lua_State *const vm, float & value )`

Pulls the top element off the stack and pops it.

In stack terms this is a top followed by pop.

##### Returns

If [OOLUA\\_STORE\\_LAST\\_ERROR](#) is set to one then the return value will indicate success or failure, if [OOLUA\\_USE\\_EXCEPTIONS](#) is set to one then failure will always be reported by throwing an exception.

##### See Also

[Error Reporting](#)  
[Exception classes](#)

#### 14.1.3.12 `bool OOLUA::pull ( lua_State *const vm, oolua_CFunction & value )`

Pulls the top element off the stack and pops it.

In stack terms this is a top followed by pop.

##### Returns

If [OOLUA\\_STORE\\_LAST\\_ERROR](#) is set to one then the return value will indicate success or failure, if [OOLUA\\_USE\\_EXCEPTIONS](#) is set to one then failure will always be reported by throwing an exception.

##### See Also

[Error Reporting](#)  
[Exception classes](#)

#### 14.1.3.13 `bool OOLUA::pull ( lua_State *const vm, Table & value )`

Pulls the top element off the stack and pops it.

In stack terms this is a top followed by pop.

**Returns**

If [OOLUA\\_STORE\\_LAST\\_ERROR](#) is set to one then the the return value will indicate success or failure, if [OOLUA\\_USE\\_EXCEPTIONS](#) is set to one then failure will always be reported by throwing an exception.

**See Also**

[Error Reporting](#)  
[Exception classes](#)

14.1.3.14 `template<typename T> bool OOLUA::pull ( lua_State *const vm, T & value ) [inline]`

Pulls the top element off the stack and pops it.

In stack terms this is a top followed by pop.

**Returns**

If [OOLUA\\_STORE\\_LAST\\_ERROR](#) is set to one then the the return value will indicate success or failure, if [OOLUA\\_USE\\_EXCEPTIONS](#) is set to one then failure will always be reported by throwing an exception.

**See Also**

[Error Reporting](#)  
[Exception classes](#)

14.1.3.15 `template<typename T> bool OOLUA::pull ( lua_State *const vm, OOLUA::cpp_acquire_ptr< T> & value ) [inline]`

Pulls the top element off the stack and pops it.

In stack terms this is a top followed by pop.

**Returns**

If [OOLUA\\_STORE\\_LAST\\_ERROR](#) is set to one then the the return value will indicate success or failure, if [OOLUA\\_USE\\_EXCEPTIONS](#) is set to one then failure will always be reported by throwing an exception.

**See Also**

[Error Reporting](#)  
[Exception classes](#)

14.1.3.16 `template<typename T> bool OOLUA::pull ( lua_State *const vm, T *& value ) [inline]`

Pulls the top element off the stack and pops it.

In stack terms this is a top followed by pop.

**Returns**

If [OOLUA\\_STORE\\_LAST\\_ERROR](#) is set to one then the the return value will indicate success or failure, if [OOLUA\\_USE\\_EXCEPTIONS](#) is set to one then failure will always be reported by throwing an exception.

**See Also**

[Error Reporting](#)  
[Exception classes](#)

#### 14.1.3.17 `bool OOLUA::push ( lua_State *const vm, void * lightud )`

Pushes an instance to top of the Lua stack.

##### Returns

If [OOLUA\\_STORE\\_LAST\\_ERROR](#) is set to one then the the return value will indicate success or failure, if [OOLUA\\_USE\\_EXCEPTIONS](#) is set to one then failure will always be reported by throwing an exception.

##### Note

Although all push methods return a boolean, most simply return true. The only versions which can return false are full userdata aswell as values which are associated with a Lua universe.

##### See Also

[OOLUA::can\\_xmove](#)  
[Error Reporting](#)  
[Exception classes](#)

#### 14.1.3.18 `bool OOLUA::push ( lua_State *const vm, bool const & value )`

Pushes an instance to top of the Lua stack.

##### Returns

If [OOLUA\\_STORE\\_LAST\\_ERROR](#) is set to one then the the return value will indicate success or failure, if [OOLUA\\_USE\\_EXCEPTIONS](#) is set to one then failure will always be reported by throwing an exception.

##### Note

Although all push methods return a boolean, most simply return true. The only versions which can return false are full userdata aswell as values which are associated with a Lua universe.

[Error Reporting](#)  
[Exception classes](#)

14.1.3.27 `template<typename T> bool OOLUA::push ( lua_State *const vm, T *const & value )` `[inline]`

Pushes an instance to top of the Lua stack.

#### Returns

If [OOLUA\\_STORE\\_LAST\\_ERROR](#) is set to one then the the return value will indicate success or failure, if [OOLUA\\_USE\\_EXCEPTIONS](#) is set to one then failure will always be reported by throwing an exception.

#### Note

Although all push methods return a boolean, most simply return true. The only versions which can return false are full userdata aswell as values which are associated with a Lua universe.

#### See Also

[OOLUA::can\\_xmove](#)  
[Error Reporting](#)  
[Exception classes](#)

14.1.3.28 `template<typename T> void OOLUA::register_class ( lua_State * vm )` `[inline]`

Registers the class type T and it's bases with an instance of [lua\\_State](#).

#### Template Parameters

|          |                                   |
|----------|-----------------------------------|
| <i>T</i> | Class type to register with OOLua |
|----------|-----------------------------------|

Registers a class type T for which there is a [Proxy\\_class](#) and also registers it's bases, if it has any, with OOLua. It preforms a check to see if the type has already been registered with the instance. This is safe to be called multiple times with a Lua universe and safe to be called with a [Proxy\\_class](#) which has no base classes.

14.1.3.29 `template<typename T, typename K, typename V> void OOLUA::register_class_static ( lua_State *const vm, K const & k, V const & v )` `[inline]`

Registers a key K and value V entry into class T.

## Template Parameters

|          |                                       |
|----------|---------------------------------------|
| <i>T</i> | Class type to register the static for |
| <i>K</i> | Key                                   |
| <i>V</i> | Value                                 |

14.1.3.30 `bool OOLUA::run_chunk ( lua_State * vm, std::string const & chunk )`

Loads and runs a chunk of code.

## Parameters

|    |              |   |
|----|--------------|---|
| in | <i>vm</i>    | Lua virtual machine. Taken from Lua manual : An opaque structure that points to a thread and indirectly (through the thread) to the whole state of a Lua interpreter. The Lua library is fully reentrant: it has no global variables. All information about a state is accessible through this structure. |
| in | <i>chunk</i> |   |

14.1.3.31 `bool OOLUA::run_file ( lua_State * vm, std::string const & filename )`

Loads and runs the file.

## Parameters

|    |                 |   |
|----|-----------------|---|
| in | <i>vm</i>       | Lua virtual machine. Taken from Lua manual : An opaque structure that points to a thread and indirectly (through the thread) to the whole state of a Lua interpreter. The Lua library is fully reentrant: it has no global variables. All information about a state is accessible through this structure. |
| in | <i>filename</i> |   |

14.1.3.32 `template<typename T> bool OOLUA::set_global ( lua_State * vm, char const * name, T & instance )`

Helper function to set a Lua global variable.

## Template Parameters

|          |                   |
|----------|-------------------|
| <i>T</i> | Type for instance |
|----------|-------------------|

## Parameters

|    |                 |  |
|----|-----------------|--|
| in | <i>vm</i>       | <a href="#">lua_State</a>                        |
| in | <i>name</i>     | Global name to set                               |
| in | <i>instance</i> | Any variable which is valid to push to the stack |

## Returns

Boolean indicating if the operation was successful

## See Also

[Error Reporting](#)

14.1.3.33 `bool OOLUA::set_global ( lua_State * vm, char const * name, lua_CFunction instance )`

None template version.

Enables setting a global with a value of lua\_CFunction without requiring you make a reference to the function.

## Parameters

|    |                 |   |
|----|-----------------|---|
| in | <i>vm</i>       | The <a href="#">lua_State</a> to work on                        |
| in | <i>name</i>     | String which is used for the global name                        |
| in | <i>instance</i> | The lua_CFuntion which will be set at the global value for name |

14.1.3.34 void OOLUA::set\_global\_to\_nil ( lua\_State \* *vm*, char const \* *name* )

Helper function to set a Lua global variable to nil.

## Parameters

|    |             |                           |
|----|-------------|---------------------------|
| in | <i>vm</i>   | <a href="#">lua_State</a> |
| in | <i>name</i> | Global name to set        |

14.1.3.35 void OOLUA::setup\_user\_lua\_state ( lua\_State \* *vm* )

Sets up a [lua\\_State](#) to work with OOLua.

If you want to use OOLua with a [lua\\_State](#) you already have active or supplied by some third party, then calling this function adds the necessary tables and globals for it to work with OOLua.

## Parameters

|    |           |   |
|----|-----------|---|
| in | <i>vm</i> | <a href="#">lua_State</a> to be initialise by OOLua |
|----|-----------|---|

## 14.2 OOLUA::STRING Namespace Reference

Defines which type of string classes can be pulled and pushed from the stack with the public API and the DSL.

### Functions

- [OOLUA\\_CLASS\\_OR\\_BASE\\_CONTAINS\\_METHOD](#) (only\_std\_string\_conforming\_with\_c\_str\_method, char const \*(U::\*)() const, c\_str) template< typename T > struct is\_integral\_string\_class  
*Performs the check on the type without including the string header.*

#### 14.2.1 Detailed Description

Defines which type of string classes can be pulled and pushed from the stack with the public API and the DSL. I would really like to be able to forward declare string types in a cross platform way; for example when using GCC we could, but really shouldn't, use bits/stringfwd.h

#### 14.2.2 Function Documentation

14.2.2.1 OOLUA::STRING::OOLUA\_CLASS\_OR\_BASE\_CONTAINS\_METHOD ( only\_std\_string\_conforming\_with\_c\_str\_method, char const \*(U::\*)() const, c\_str )

Performs the check on the type without including the string header.

To add a different string class type, see the commented out macros in oolua\_string.h.

## Chapter 15

# Class Documentation

### 15.1 OOLUA::Abstract Struct Reference

The class being mirrored is an abstract class.

```
#include <proxy_tags.h>
```

#### 15.1.1 Detailed Description

The class being mirrored is an abstract class.

When OOLua encounters the [Abstract](#) tag it will not look for any constructors for the type and the type will not be constructable from Lua. Specifying an [OOLUA\\_CTORS](#) block will have no effect and such a block will be ignored.

The documentation for this struct was generated from the following file:

- [proxy\\_tags.h](#)

### 15.2 OOLUA::Add\_op Struct Reference

Addition operator is defined for the type.

```
#include <proxy_tags.h>
```

#### 15.2.1 Detailed Description

Addition operator is defined for the type.

The documentation for this struct was generated from the following file:

- [proxy\\_tags.h](#)

### 15.3 OOLUA::calling\_lua\_state Struct Reference

Special parameter type.

```
#include <oolua_traits.h>
```

### 15.3.1 Detailed Description

Special parameter type.

This is different from all other traits as it does not take a type, yet is a type. It informs OOLua that the calling state is a parameter for a function

The documentation for this struct was generated from the following file:

- oolua\_traits.h

## 15.4 OOLUA::cpp\_acquire\_ptr< T > Struct Template Reference

Change of ownership to C++.

```
#include <oolua_traits.h>
```

### 15.4.1 Detailed Description

```
template<typename T>struct OOLUA::cpp_acquire_ptr< T >
```

Change of ownership to C++.

Informs the library that C++ will take control of the pointer being used and call delete on it when appropriate. This is only valid for public API functions which [OOLUA::pull](#) from the stack.

The documentation for this struct was generated from the following file:

- oolua\_traits.h

## 15.5 OOLUA::cpp\_in\_p< T > Struct Template Reference

Input parameter trait which will be owned by C++.

```
#include <oolua_traits.h>
```

### 15.5.1 Detailed Description

```
template<typename T>struct OOLUA::cpp_in_p< T >
```

Input parameter trait which will be owned by C++.

Parameter supplied via Lua changes ownership to C++.

The documentation for this struct was generated from the following file:

- oolua\_traits.h

## 15.6 OOLUA::Div\_op Struct Reference

Division operator is defined for the type.

```
#include <proxy_tags.h>
```

### 15.6.1 Detailed Description

Division operator is defined for the type.

The documentation for this struct was generated from the following file:

- [proxy\\_tags.h](#)

## 15.7 OOLUA::Equal\_op Struct Reference

Equal operator is defined for the type.

```
#include <proxy_tags.h>
```

### 15.7.1 Detailed Description

Equal operator is defined for the type.

The documentation for this struct was generated from the following file:

- [proxy\\_tags.h](#)

## 15.8 OOLUA::Exception Struct Reference

Base class for OOLua exceptions.

```
#include <oolua_exception.h>
```

Inherits std::exception.

Inherited by [OOLUA::File\\_error](#), [OOLUA::Memory\\_error](#), [OOLUA::Runtime\\_error](#), [OOLUA::Syntax\\_error](#), and [OOLUA::Type\\_error](#).

### 15.8.1 Detailed Description

Base class for OOLua exceptions.

See Also

[Error Reporting](#)

The documentation for this struct was generated from the following file:

- [oolua\\_exception.h](#)

## 15.9 OOLUA::File\_error Struct Reference

Reports LUA\_ERRFILE.

```
#include <oolua_exception.h>
```

Inherits [OOLUA::Exception](#).

### 15.9.1 Detailed Description

Reports LUA\_ERRFILE.

See Also

[Error Reporting](#)

The documentation for this struct was generated from the following file:

- [oolua\\_exception.h](#)

## 15.10 HasIntMember Struct Reference

```
#include <cpp_userdata_function_params.h>
```

### 15.10.1 Detailed Description

[CppOutParamsUserData]

The documentation for this struct was generated from the following file:

- [cpp\\_userdata\\_function\\_params.h](#)

## 15.11 Hello\_moon Class Reference

Inherits [TestFixture](#).

### Public Member Functions

- void [hello\\_minimalist\\_function](#) ()
- void [hello\\_expressive\\_function](#) ()
- void [hello\\_cast\\_minimalist\\_function](#) ()
- void [hello\\_function\\_no\\_registration](#) ()
- void [hello\\_class\\_function](#) ()

### 15.11.1 Detailed Description

[HelloMoonClass]

### 15.11.2 Member Function Documentation

15.11.2.1 void [Hello\\_moon::hello\\_cast\\_minimalist\\_function](#) ( ) [[inline](#)]

[[HelloMoonCFuncExpressiveUsage](#)] [[HelloMoonCFuncCastUsage](#)]

15.11.2.2 void [Hello\\_moon::hello\\_class\\_function](#) ( ) [[inline](#)]

[[HelloMoonCFuncAndProxyUsageLua](#)]

15.11.2.3 void Hello\_moon::hello\_expressive\_function ( ) [inline]

[HelloMoonCFuncMinimalistUsage] [HelloMoonCFuncExpressiveUsage]

15.11.2.4 void Hello\_moon::hello\_function\_no\_registration ( ) [inline]

[HelloMoonCFuncCastUsage] [HelloMoonCFuncAndProxyUsageLua]

15.11.2.5 void Hello\_moon::hello\_minimalist\_function ( ) [inline]

[HelloMoonCFuncMinimalistUsage]

The documentation for this class was generated from the following file:

- hello\_moon.cpp

## 15.12 OOLUA::in\_out\_p< T > Struct Template Reference

Input and output parameter trait.

```
#include <oolua_traits.h>
```

### 15.12.1 Detailed Description

```
template<typename T>struct OOLUA::in_out_p< T >
```

Input and output parameter trait.

The calling Lua procedure supplies the parameter to the proxied function, the value of the parameter after the proxied call will be passed back to the calling procedure as a return value. No change of ownership occurs.

The documentation for this struct was generated from the following file:

- oolua\_traits.h

## 15.13 OOLUA::in\_p< T > Struct Template Reference

Input parameter trait.

```
#include <oolua_traits.h>
```

### 15.13.1 Detailed Description

```
template<typename T>struct OOLUA::in_p< T >
```

Input parameter trait.

The calling Lua procedure supplies the parameter to the proxied function. No change of ownership occurs.

#### Note

This is the default trait used for function parameters when no trait is supplied.

The documentation for this struct was generated from the following file:

- oolua\_traits.h

## 15.14 OOLUA::in\_p< char \* > Struct Template Reference

Specialisation for C style strings.

```
#include <oolua_traits.h>
```

### 15.14.1 Detailed Description

```
template<>struct OOLUA::in_p< char * >
```

Specialisation for C style strings.

The documentation for this struct was generated from the following file:

- [oolua\\_traits.h](#)

## 15.15 OOLUA::Less\_equal\_op Struct Reference

Less than or equal operator is defined for the type.

```
#include <proxy_tags.h>
```

### 15.15.1 Detailed Description

Less than or equal operator is defined for the type.

The documentation for this struct was generated from the following file:

- [proxy\\_tags.h](#)

## 15.16 OOLUA::Less\_op Struct Reference

Less than operator is defined for the type.

```
#include <proxy_tags.h>
```

### 15.16.1 Detailed Description

Less than operator is defined for the type.

The documentation for this struct was generated from the following file:

- [proxy\\_tags.h](#)

## 15.17 OOLUA::light\_p< T > Struct Template Reference

Input parameter trait.

```
#include <oolua_traits.h>
```

### 15.17.1 Detailed Description

```
template<typename T>struct OOLUA::light_p< T >
```

Input parameter trait.

The calling Lua procedure supplies a `LUA_TLIGHTUSERDATA` which will be cast to the requested `T` type. If `T` is not the correct type for the light userdata then the casting is undefined. A light userdata is never owned by Lua

The documentation for this struct was generated from the following file:

- `oolua_traits.h`

## 15.18 OOLUA::light\_return< T > Struct Template Reference

Return trait for a light userdata type.

```
#include <oolua_traits.h>
```

### 15.18.1 Detailed Description

```
template<typename T>struct OOLUA::light_return< T >
```

Return trait for a light userdata type.

The type returned from the function is either a void pointer or a pointer to another type. When the function returns, it will push a `LUA_TLIGHTUSERDATA` to the stack even when the pointer is `NULL`; therefore a `NULL` pointer using this traits is never converted to a Lua `nil` value. A light userdata is also never owned by Lua and OOLua does not store any type information for the it; [light\\_return](#) is a black box which when used incorrectly will invoke undefined behaviour.

This is only valid for function return types.

The documentation for this struct was generated from the following file:

- `oolua_traits.h`

## 15.19 OOLUA::lua\_acquire\_ptr< T > Struct Template Reference

Change of ownership to Lua.

```
#include <oolua_traits.h>
```

### 15.19.1 Detailed Description

```
template<typename T>struct OOLUA::lua_acquire_ptr< T >
```

Change of ownership to Lua.

Informs the library that Lua will take control of the pointer being used and call `delete` on it when appropriate. This is only valid for public API functions which [OOLUA::push](#) to the stack.

The documentation for this struct was generated from the following file:

- `oolua_traits.h`

## 15.20 OOLUA::Lua\_function Struct Reference

Structure which is used to call a Lua function.

```
#include <oolua_function.h>
```

### 15.20.1 Detailed Description

Structure which is used to call a Lua function.

[Lua\\_function](#) is a [lua\\_State](#) function caller object, the state in which it calls a function is specified in either the [constructor](#) or via [bind\\_script](#). This object provides function call operator overloads up to "[lua\\_params](#)" count + 1 parameters, the first of which being the function which is to be called and it's type maybe one of:

- `std::string` A function in Lua's global table
- [OOLUA::Lua\\_func\\_ref](#) A reference to a function
- `int` A valid stack index

### 15.20.2 Constructor & Destructor Documentation

#### 15.20.2.1 OOLUA::Lua\_function::Lua\_function ( )

Default constructor initialises the object.

##### Postcondition

Any call to a function call operator will cause an error until a [lua\\_State](#) is bound via [bind\\_script](#)

### 15.20.3 Member Function Documentation

#### 15.20.3.1 `template<typename FUNC_TYPE , typename P1 , typename P2 , typename P3 , typename P4 , typename P5 > bool OOLUA::Lua_function::operator() ( FUNC_TYPE const & func, P1 p1, P2 p2, P3 p3, P4 p4, P5 p5 )`

Function call operator.

##### Returns

Result indicating success

[Error Reporting](#)

The documentation for this struct was generated from the following file:

- [oolua\\_function.h](#)

## 15.21 OOLUA::lua\_maybe\_null< T > Struct Template Reference

Return trait for a pointer which at runtime maybe NULL and also allowing transfer of ownership.

```
#include <oolua_traits.h>
```

### 15.21.1 Detailed Description

```
template<typename T>struct OOLUA::lua_maybe_null< T >
```

Return trait for a pointer which at runtime maybe NULL and also allowing transfer of ownership.

The type returned from the function is a pointer instance whose runtime value maybe NULL. If it is NULL then lua\_pushnil will be called else the pointer will be pushed and transfer ownership of the instance to Lua. This is only valid for function return types.

## Note

To be consistent in naming this should really be called lua\_maybe\_null\_return, however I feel this would be too long a name for the trait so "return" has been dropped.

The documentation for this struct was generated from the following file:

- [oolua\\_traits.h](#)

## 15.22 OOLUA::lua\_out\_p< T > Struct Template Reference

Output parameter trait which will be owned by Lua.

```
#include <oolua_traits.h>
```

### 15.22.1 Detailed Description

```
template<typename T>struct OOLUA::lua_out_p< T >
```

Output parameter trait which will be owned by Lua.

Lua code does not pass an instance to the C++ function, yet the pushed back value after the function call will be owned by Lua. This is meaningful only if called with a type which has a proxy and it is by reference, otherwise undefined.

The documentation for this struct was generated from the following file:

- [oolua\\_traits.h](#)

## 15.23 OOLUA::Lua\_ref< ID > Struct Template Reference

A typed wrapper for a Lua reference.

```
#include <oolua_ref.h>
```

### Public Member Functions

- [lua\\_State](#) \* [state](#) () const  
*Returns the [lua\\_State](#) associated with the Lua reference.*
- int const & [ref](#) () const  
*Returns the integer Lua reference value.*

### 15.23.1 Detailed Description

```
template<int ID>struct OOLUA::Lua_ref< ID >
```

A typed wrapper for a Lua reference.

The [Lua\\_ref](#) templated class stores a reference using Lua's reference system [luaL\\_ref](#) and [luaL\\_unref](#), along with a [lua\\_State](#). The reason this class stores the [lua\\_State](#) is to make it difficult to use the reference with another universe. A reference from the same Lua universe, even if it is from a different [lua\\_State](#), is valid to be used in the universe.

The class takes ownership of any reference passed either to the [two argument constructor](#) or the [set\\_ref](#) function. On going out of scope a [valid](#) reference is guaranteed to be released, you may also force a release by passing an instance to [swap](#) for which [valid](#) returns false.

There are two special values for the reference which Lua provides, both of which OOLua will treat as an invalid reference:

- LUA\_REFNIL [luaL\\_ref](#) return value to indicate it encountered a nil object at the location the ref was asked for
- LUA\_NOREF guaranteed to be different from any reference return by [luaL\\_ref](#)

## Template Parameters

|           |                                  |
|-----------|----------------------------------|
| <i>ID</i> | Lua type as returned by lua_type |
|-----------|----------------------------------|

## Note

- Universe: A call to luaL\_newstate or lua\_newstate creates a Lua universe and a universe is completely independent of any other universe. lua\_newthread and coroutine.create, create a [lua\\_State](#) in an already existing universe.

Term first heard in a Lua mailing list post by Mark Hamburg.

## 15.23.2 Constructor &amp; Destructor Documentation

15.23.2.1 `template<int ID> OOLUA::Lua_ref< ID >::Lua_ref ( lua_State *const vm, int const & ref )`

Sets the [lua\\_State](#) and reference for the instance.

## Note

this does not perform any validation on the parameters and it is perfectly acceptable to pass parameters such that a call to valid will return false.

15.23.2.2 `template<int ID> OOLUA::Lua_ref< ID >::Lua_ref ( Lua_ref< ID > const & rhs )`

Creates a copy of rhs.

If rhs is valid then creates a new Lua reference to the value which rhs refers to, otherwise it initialises this instance so that a [Lua\\_ref::valid](#) call returns false.

## 15.23.3 Member Function Documentation

15.23.3.1 `template<int ID> void OOLUA::Lua_ref< ID >::set_ref ( lua_State *const vm, int const & ref )`

Sets the stored reference and state.

Releases any currently stored reference and takes ownership of the passed reference.

15.23.3.2 `template<int ID> void OOLUA::Lua_ref< ID >::swap ( Lua_ref< ID > & rhs )`

Swaps the Lua instance and the registry reference with rhs.

Swaps the [lua\\_State](#) and reference with rhs, this is a simple swap and does not call luaL\_ref therefore it will not create any new references.

The documentation for this struct was generated from the following file:

- oolua\_ref.h

## 15.24 OOLUA::lua\_return&lt; T &gt; Struct Template Reference

Return trait for a type which will be owned by Lua.

```
#include <oolua_traits.h>
```

### 15.24.1 Detailed Description

```
template<typename T> struct OOLUA::lua_return< T >
```

Return trait for a type which will be owned by Lua.

The type returned from the function is a heap allocated instance whose ownership will be controlled by Lua. This is only valid for function return types.

The documentation for this struct was generated from the following file:

- oolua\_traits.h

## 15.25 lua\_State Struct Reference

Lua virtual machine.

### 15.25.1 Detailed Description

Lua virtual machine.

Taken from Lua manual : An opaque structure that points to a thread and indirectly (through the thread) to the whole state of a Lua interpreter. The Lua library is fully reentrant: it has no global variables. All information about a state is accessible through this structure.

The documentation for this struct was generated from the following file:

- oolua.dox

## 15.26 OOLUA::maybe\_null< T > Struct Template Reference

Return trait for a pointer which at runtime maybe NULL.

```
#include <oolua_traits.h>
```

### 15.26.1 Detailed Description

```
template<typename T> struct OOLUA::maybe_null< T >
```

Return trait for a pointer which at runtime maybe NULL.

The type returned from the function is a pointer instance whose runtime value maybe NULL. If it is NULL then lua\_pushnil will be called else the pointer will be pushed as normal. No change of ownership will occur for the type. This is only valid for function return types.

#### Note

To be consistent in naming this should really be called maybe\_null\_return, however I feel this would be too long a name for the trait so "return" has been dropped.

The documentation for this struct was generated from the following file:

- oolua\_traits.h

## 15.27 OOLUA::Memory\_error Struct Reference

Reports LUA\_ERRMEM.

```
#include <oolua_exception.h>
```

Inherits [OOLUA::Exception](#).

### 15.27.1 Detailed Description

Reports LUA\_ERRMEM.

See Also

[Error Reporting](#)

The documentation for this struct was generated from the following file:

- [oolua\\_exception.h](#)

## 15.28 MockOutParamsUserData Class Reference

```
#include <cpp_out_params.h>
```

Inherits [OutParamsUserData](#).

### 15.28.1 Detailed Description

[CppOutParamsUserData]

The documentation for this class was generated from the following file:

- [cpp\\_out\\_params.h](#)

## 15.29 OOLUA::Mul\_op Struct Reference

Multiplication operator is defined for the type.

```
#include <proxy_tags.h>
```

### 15.29.1 Detailed Description

Multiplication operator is defined for the type.

The documentation for this struct was generated from the following file:

- [proxy\\_tags.h](#)

## 15.30 OOLUA::No\_default\_constructor Struct Reference

There is not a default constructor in the public interface yet there are other constructors.

```
#include <proxy_tags.h>
```

### 15.30.1 Detailed Description

There is not a default constructor in the public interface yet there are other constructors.

There is not a public default constructor or you do not wish to expose such a constructor, yet there are other constructors which will be specified by [OOLUA\\_CTOR](#) entries inside a [OOLUA\\_CTOR](#) block.

The documentation for this struct was generated from the following file:

- [proxy\\_tags.h](#)

## 15.31 OOLUA::No\_public\_constructors Struct Reference

There are no constructors in the public interface.

```
#include <proxy_tags.h>
```

### 15.31.1 Detailed Description

There are no constructors in the public interface.

When OOLua encounters this tag it will not look for any constructors for the type and the type will not be constructable from Lua. Specifying an OOLUA\_CTOR block will have no effect and such a block will be ignored.

The documentation for this struct was generated from the following file:

- [proxy\\_tags.h](#)

## 15.32 OOLUA::No\_public\_destructor Struct Reference

There is not a destructor in the public interface and OOLua will not attempt to delete an instance of this type.

```
#include <proxy_tags.h>
```

### 15.32.1 Detailed Description

There is not a destructor in the public interface and OOLua will not attempt to delete an instance of this type.

The documentation for this struct was generated from the following file:

- [proxy\\_tags.h](#)

## 15.33 OOLUA::Not\_equal\_op Struct Reference

Not equal operator is defined for the type.

```
#include <proxy_tags.h>
```

### 15.33.1 Detailed Description

Not equal operator is defined for the type.

The documentation for this struct was generated from the following file:

- [proxy\\_tags.h](#)

## 15.34 OOLUA::out\_p< T > Struct Template Reference

Output parameter trait.

```
#include <oolua_traits.h>
```

### 15.34.1 Detailed Description

```
template<typename T>struct OOLUA::out_p< T >
```

Output parameter trait.

The calling Lua procedure does not pass the parameter to the proxied function, instead one is created using the default constructor and passed to the proxied function. The result after the proxied call will be returned to the calling procedure. If this is a type which has a proxy then it will cause a heap allocation of the type, which Lua will own.

The documentation for this struct was generated from the following file:

- oolua\_traits.h

## 15.35 OutParamsUserData Class Reference

```
#include <cpp_out_params.h>
```

Inherited by [MockOutParamsUserData](#).

### 15.35.1 Detailed Description

[CppOutParamsUserData]

The documentation for this class was generated from the following file:

- cpp\_out\_params.h

## 15.36 OOLUA::Proxy\_class< T > Class Template Reference

A template wrapper for class objects of type T used by the script binding.

```
#include <proxy_class.h>
```

### 15.36.1 Detailed Description

```
template<typename T>class OOLUA::Proxy_class< T >
```

A template wrapper for class objects of type T used by the script binding.

Template Parameters

|          |                            |
|----------|----------------------------|
| <i>T</i> | Type that is being proxied |
|----------|----------------------------|

#### See Also

[DSL](#) for the macros which are used to define a proxy class.

The documentation for this class was generated from the following file:

- [oolua\\_pull.h](#)

## 15.37 OOLUA::Register\_class\_enums Struct Reference

The class has enums to register.

```
#include <proxy_tags.h>
```

### 15.37.1 Detailed Description

The class has enums to register.

The class has enums which are specified inside the OOLUA\_ENUMS block, these entries will be registered with a [lua\\_State](#) when the proxy type is.

The documentation for this struct was generated from the following file:

- [proxy\\_tags.h](#)

## 15.38 ReturnOrder Struct Reference

### 15.38.1 Detailed Description

[CppTypeReturnOrderOneParam]

The documentation for this struct was generated from the following file:

- [return\\_order.cpp](#)

## 15.39 OOLUA::Runtime\_error Struct Reference

Reports LUA\_ERRRUN.

```
#include <oolua_exception.h>
```

Inherits [OOLUA::Exception](#).

### 15.39.1 Detailed Description

Reports LUA\_ERRRUN.

bool [push](#) (T const &t)  
*Helper function.*

## Public Attributes

- [Lua\\_function call](#)

### 15.41.1 Detailed Description

OOLua helper class.

OOLua is purposely designed not to be dependent on the [Script](#) class and therefore passes around it's dependency of a [lua\\_State](#) instance. The [Script](#) class is only a helper and anything you can do with it can be accomplished either via using a [Lua\\_function](#) struct, calling [OOLUA](#) namespaced functions or using the Lua C API.

[Script](#) provides the following :

- Scopes a [lua\\_State](#) pointer
- Provides access to the [lua\\_State](#) pointer via a cast operator and [function](#)
- Provides methods to [register](#) types
- Binds a [Lua\\_function](#) instance to [call](#) functions
- Has member functions for a little state management
- [Sets up](#) the state to work with OOLua

#### Note

This class is not copy constructible or assignable. To accomplish this a counted reference to the [lua\\_State](#) would need to be maintained.

If you do not want to or can not use this class please see [setup\\_user\\_lua\\_state](#)

### 15.41.2 Member Function Documentation

#### 15.41.2.1 `bool OOLUA::Script::load_chunk ( std::string const & chunk )`

Helper function.

See Also

[OOLUA::load\\_chunk](#)

#### 15.41.2.2 `bool OOLUA::Script::load_file ( std::string const & filename )`

Helper function.

See Also

[OOLUA::load\\_file](#)

#### 15.41.2.3 `template<typename T> bool OOLUA::Script::pull ( T & t ) [inline]`

Helper function.

See Also

[OOLUA::pull](#)

15.41.2.4 `template<typename T> bool OOLUA::Script::push ( T const & t ) [inline]`

Helper function.

See Also

[OOLUA::push](#)

15.41.2.5 `template<typename T> void OOLUA::Script::register_class ( ) [inline]`

Helper function.

See Also

[OOLUA::register\\_class](#)

15.41.2.6 `template<typename T> void OOLUA::Script::register_class ( T * ) [inline]`

Helper function.

See Also

[OOLUA::register\\_class](#)

15.41.2.7 `template<typename T, typename K, typename V> void OOLUA::Script::register_class_static ( K const & k, V const & v ) [inline]`

Helper function.

See Also

[OOLUA::register\\_class\\_static](#)

15.41.2.8 `bool OOLUA::Script::run_chunk ( std::string const & chunk )`

Helper function.

See Also

[OOLUA::run\\_chunk](#)

15.41.2.9 `bool OOLUA::Script::run_file ( std::string const & filename )`

Helper function.

See Also

[OOLUA::run\\_file](#)

**15.41.2.10** `lua_State* const& OOLUA::Script::state ( ) const` `[inline]`

Sometimes you may want to be explicit.

See Also

`Script::operator()`

### 15.41.3 Member Data Documentation

#### 15.41.3.1 `Lua_function` `OOLUA::Script::call`

Function object instance which can be used to call Lua functions

The documentation for this class was generated from the following file:

- [oolua\\_script.h](#)

## 15.42 Stub1 Struct Reference

```
#include <cpp_stub_classes.h>
```

### 15.42.1 Detailed Description

[UsedAsMinimalClass]

The documentation for this struct was generated from the following file:

- `cpp_stub_classes.h`

## 15.43 Stub2 Struct Reference

```
#include <cpp_stub_classes.h>
```

### 15.43.1 Detailed Description

[UsedAsMinimalClass]

The documentation for this struct was generated from the following file:

- `cpp_stub_classes.h`

## 15.44 OOLUA::Sub\_op Struct Reference

Subtraction operator is defined for the type.

```
#include <proxy_tags.h>
```

### 15.44.1 Detailed Description

Subtraction operator is defined for the type.

The documentation for this struct was generated from the following file:

- [proxy\\_tags.h](#)

## 15.45 OOLUA::Syntax\_error Struct Reference

Reports LUA\_ERRSYNTAX.

```
#include <oolua_exception.h>
```

Inherits [OOLUA::Exception](#).

### 15.45.1 Detailed Description

Reports LUA\_ERRSYNTAX.

See Also

[Error Reporting](#)

The documentation for this struct was generated from the following file:

- [oolua\\_exception.h](#)

## 15.46 OOLUA::Table Class Reference

Wrapper around a table in Lua which allows easy usage.

```
#include <oolua_table.h>
```

### Public Member Functions

- bool [valid](#) () const  
*Returns a boolean which is the result of checking the state of the internal Lua\_func\_ref.*
- void [traverse](#) (traverse\_do\_function do\_)
- lua\_State \* [state](#) () const  
*Provides access to the associated lua\_State.*
- [Table](#) ()  
*Default creates an object on which a call to valid returns false.*
- [Table](#) (Lua\_table\_ref const &ref)  
*Initialises the reference to be an instance of the same registry reference or an invalid table if ref.valid() == false.*
- [Table](#) (lua\_State \*const vm, std::string const &name)  
*Sets the lua\_State and calls Lua\_table::set\_table.*
- [Table](#) ([Table](#) const &rhs)  
*Default creates an object on which a call to valid returns false.*
- [Table](#) & [operator=](#) ([Table](#) const &)  
*unimplemented*
- void [bind\\_script](#) (lua\_State \*const vm)  
*Associates the instance with the lua\_State vm.*
- void [set\\_table](#) (std::string const &name)  
*Order of trying to initialise :*
- void [set\\_ref](#) (lua\_State \*const vm, int const &ref)

- Initialises the internal `Lua_func_ref` to the id ref.*
- void [swap](#) (Table &rhs)  
*Swaps the internal `Lua_func_ref` and `rhs.m_table_ref`.*
- template<typename T , typename T1 >  
void [try\\_at](#) (T const &key, T1 &value)  
*Function which throws on an error.*
- template<typename T , typename T1 >  
bool [safe\\_at](#) (T const &key, T1 &value)  
*A safe version of [at](#), which will always return a boolean indicating the success of the function call.*
- template<typename T , typename T1 >  
T1 & [at](#) (T const &key, T1 &value)
- template<typename T , typename T1 >  
void [set](#) (T const &key, T1 const &value)  
*Inserts the key value pair into the table if key is not present else it updates the table's key entry.*
- template<typename T >  
void [remove](#) (T const &key)  
*Removes the key from the table by setting it's value to nil.*

### 15.46.1 Detailed Description

Wrapper around a table in Lua which allows easy usage.

[Table](#) provides a simple typed C++ interface for the Lua unordered and ordered associative container of the same name. Operations which use the Lua stack ensure that the stack is the same on exit as it was on entry, OOLua tries to force a clean stack([OOLua and the Lua stack](#)).

Any value can be retrieved or set from the table via the use of the template member functions [set](#), [at](#) or [safe\\_at](#). If the value asked for is not the correct type located in the position an error can be reported, the type of which depends on [Error Reporting](#) and the function which was called. See individual member function documentation for details.

#### Note

The member function [try\\_at](#) is only defined when exceptions are enabled for the library.

### 15.46.2 Member Function Documentation

15.46.2.1 template<typename T , typename T1 > T1 & Table::at ( T const & *key*, T1 & *value* ) [inline]

#### Template Parameters

|           |            |
|-----------|------------|
| <i>T</i>  | Key type   |
| <i>T1</i> | Value type |

#### Parameters

|     |              |                                    |
|-----|--------------|------------------------------------|
| in  | <i>key</i>   |                                    |
| out | <i>value</i> | zreturn The same instance as value |

#### Note

No error checking.

It is undefined to call this function when:

- table or the key are invalid
- table does not contain the key
- value is not the correct type

## See Also

Lua\_table::safe\_at  
 Lua\_table::try\_at

## 15.46.2.2 void OOLUA::Table::bind\_script ( lua\_State \*const vm )

Associates the instance with the [lua\\_State](#) vm.

Associates the instance with the [lua\\_State](#) vm. If the table already has a [lua\\_State](#) bound to it

- If the Current bound instance is not equal to vm and the table has a valid reference, it releases the currently set reference and sets vm as the bound instance.

## 15.46.2.3 template&lt;typename T , typename T1 &gt; bool Table::safe\_at ( T const &amp; key, T1 &amp; value ) [inline]

A safe version of [at](#), which will always return a boolean indicating the success of the function call.

This function will not throw an exception when exceptions are enabled for the library.

## Template Parameters

|           |            |
|-----------|------------|
| <i>T</i>  | Key type   |
| <i>T1</i> | Value type |

## Parameters

|     |              |  |
|-----|--------------|--|
| in  | <i>key</i>   |  |
| out | <i>value</i> |  |

## 15.46.2.4 void OOLUA::Table::set\_table ( std::string const &amp; name )

Order of trying to initialise :

- name.empty() == true: Creates an invalid object.
- name found as a table in Lua global: Swaps the internal Lua\_func\_ref with an instance initialised to an id obtained from the Lua registry.
- name found as a table in Lua registry: Swaps the internal Lua\_func\_ref with an instance initialised to an id obtained from the Lua registry.
- else Swaps the internal Lua\_func\_ref with an uninitialised instance.

## 15.46.2.5 void OOLUA::Table::traverse ( traverse\_do\_function do\_ )

## Deprecated

## 15.46.2.6 template&lt;typename T , typename T1 &gt; void OOLUA::Table::try\_at ( T const &amp; key, T1 &amp; value )

Function which throws on an error.

## Note

This function is only defined when exceptions are enable for the library

## Template Parameters

|           |            |
|-----------|------------|
| <i>T</i>  | Key type   |
| <i>T1</i> | Value type |

## Parameters

|     |              |  |
|-----|--------------|--|
| in  | <i>key</i>   |  |
| out | <i>value</i> |  |

The documentation for this class was generated from the following file:

- [oolua\\_table.h](#)

## 15.47 TestingReturnOrder Class Reference

Inherits `TestFixture`.

### Public Member Functions

- void [luaReturnOrder\\_luaFunctionWhichReturnsMultipleValuesToCpp\\_orderFromTopOfStackIsInput2Input1](#) ()
- void [ordering\\_functionWhichHasAReturnValueAndAlsoReturnsAnInOutParam\\_topOfStackIsTheInOutParam](#) ()

#### 15.47.1 Detailed Description

[CppTraitReturnOrderOneParam] [ProxyTraitReturnOrderOneParam] [ProxyTraitReturnOrderOneParam]

#### 15.47.2 Member Function Documentation

15.47.2.1 void `TestingReturnOrder::luaReturnOrder_luaFunctionWhichReturnsMultipleValuesToCpp_orderFromTopOfStackIsInput2Input1` ( ) `[inline]`

[TestLuaReturnOrder]

15.47.2.2 void `TestingReturnOrder::ordering_functionWhichHasAReturnValueAndAlsoReturnsAnInOutParam_slotBeneathTopOfStackIsFunctionReturn` ( ) `[inline]`

[TestTraitReturnOrderTop] [TestTraitReturnOrderNextSlot]

15.47.2.3 void `TestingReturnOrder::ordering_functionWhichHasAReturnValueAndAlsoReturnsAnInOutParam_topOfStackIsTheInOutParam` ( ) `[inline]`

[TestLuaReturnOrder] [TestTraitReturnOrderTop]

The documentation for this class was generated from the following file:

- `return_order.cpp`

## 15.48 OOLUA::Type\_error Struct Reference

Reports that a type pulled from the stack was not the type that was asked for.

```
#include <oolua_exception.h>
```

Inherits [OOLUA::Exception](#).

### 15.48.1 Detailed Description

Reports that a type pulled from the stack was not the type that was asked for.

See Also

[Error Reporting](#)

Note

Implicit casts such as a derived class to a base class are not type errors

The documentation for this struct was generated from the following file:

- [oolua\\_exception.h](#)

## Chapter 16

# File Documentation

### 16.1 dsl\_va\_args.h File Reference

#### Macros

- `#define OOLUA_PROXY(...)`  
*Starts the generation a proxy class.*
- `#define OOLUA_MEM_FUNC(...)`  
*Generates a member function proxy which will also be the named FunctionName.*
- `#define OOLUA_MEM_FUNC_RENAME(...)`  
*Generates a member function proxy which will be the named ProxyFunctionName.*
- `#define OOLUA_MEM_FUNC_CONST(...)`  
*Generates a constant member function proxy which will also be the named FunctionName.*
- `#define OOLUA_MEM_FUNC_CONST_RENAME(...)`  
*Generates a constant member function which will be named ProxyFunctionName.*
- `#define OOLUA_C_FUNCTION(...)`  
*Generates a block which will call the C function FunctionName.*
- `#define OOLUA_MFUNC(...)`  
*Deduce and generate a proxy for a member function.*
- `#define OOLUA_MFUNC_CONST(...)`  
*Deduce and generate a proxy for a constant member function.*
- `#define OOLUA_CFUNC(...)`  
*Deduce and generate a proxy for a C function.*
- `#define OOLUA_SFUNC(...)`  
*Deduce and generate a proxy for a class static function.*
- `#define OOLUA_EXPORT_FUNCTIONS(...)`  
*Exports zero or more member functions which will be registered with Lua.*
- `#define OOLUA_EXPORT_FUNCTIONS_CONST(...)`  
*Exports zero or more const member functions which will be registered with Lua.*
- `#define OOLUA_TAGS(...)`  
*Allows more information to be specified about the proxy class.*
- `#define OOLUA_MGET(...)`  
*Generates a getter, which is a constant function, to retrieve a public instance.*
- `#define OOLUA_MSET(...)`  
*Generates a setter, which is a none constant function, to set the public instance.*
- `#define OOLUA_MGET_MSET(...)`  
*Generates a getter and setter for a public instance.*

## 16.2 lua\_includes.h File Reference

Prevents name mangling and provides a potential location to enable compatibility when new Lua versions are released.

```
#include "lua/lua.h"
#include "lua/lauxlib.h"
#include "lua/lualib.h"
```

### 16.2.1 Detailed Description

Prevents name mangling and provides a potential location to enable compatibility when new Lua versions are released. No part of OOLua directly includes any Lua header files, instead when required they include this header. Contrary to what some people may think, this is by design. There is no way to know if a user's version of the Lua library was compiled as C++ or C.

## 16.3 lvd\_type\_traits.h File Reference

Template struct which report if the type has qualifiers and also removes some of the possible qualifiers.

### 16.3.1 Detailed Description

Template struct which report if the type has qualifiers and also removes some of the possible qualifiers.

## 16.4 lvd\_types.h File Reference

```
#include "platform_check.h"
#include "type_list.h"
```

### 16.4.1 Detailed Description

Header for the types used.

## 16.5 only\_for\_doxygen.h File Reference

### Typedefs

- `typedef int(* lua_CFunction)(lua_State *vm)`  
*Lua's C function signature.*

### 16.5.1 Typedef Documentation

#### 16.5.1.1 `typedef int(* lua_CFunction)(lua_State *vm)`

Lua's C function signature.

This is a Lua type which is the required signature to bind C functions to Lua.

## Parameters

|                 |                 |  |
|-----------------|-----------------|--|
| <code>in</code> | <code>vm</code> | The virtual machine for which a function will operate on |
|-----------------|-----------------|--|

## Returns

Number of function returns to Lua

## 16.6 oolua.h File Reference

```
#include "lua_includes.h"
#include "oolua_dsl.h"
#include "proxy_function_exports.h"

#include "oolua_table.h"
#include "oolua_ref.h"
#include "oolua_helpers.h"
```

## Namespaces

- [OOLUA](#)

*This is the root namespace of the Library.*

## Functions

- `template<typename T >`  
`bool OOLUA::set_global (lua_State *vm, char const *name, T &instance)`  
*Helper function to set a Lua global variable.*
- `bool OOLUA::set_global (lua_State *vm, char const *name, lua_CFunction instance)`  
*None template version.*
- `void OOLUA::set_global_to_nil (lua_State *vm, char const *name)`  
*Helper function to set a Lua global variable to nil.*
- `template<typename T >`  
`bool OOLUA::get_global (lua_State *vm, char const *name, T &instance)`  
*Helper function to set a Lua global variable.*

### 16.6.1 Detailed Description

Header file for Object Oriented Lua.

## 16.7 oolua\_boilerplate.h File Reference

### 16.7.1 Detailed Description

**Date**

Wed Oct 23 17:57:13 2013

Configurable values as set when generating this file

- constructor\_params 5 - Maximum amount of parameters for a constructor of a proxied type (Default 5)
- lua\_params 10 - Maximum amount of parameters for a call to a Lua function (Default 10)
- cpp\_params 8 - Maximum number of parameters a C++ function can have (Default 8)

**Note**

Warning this file was generated, edits to the file will not persist if it is regenerated.

## 16.8 oolua\_chunk.h File Reference

Provides methods for running and loading chunks.

```
#include <string>
```

**Namespaces**

- [OOLUA](#)

*This is the root namespace of the Library.*

**Functions**

- bool [OOLUA::load\\_chunk](#) (lua\_State \*vm, std::string const &chunk)  
*Loads a chunk leaving the resulting function on the stack.*
- bool [OOLUA::run\\_chunk](#) (lua\_State \*vm, std::string const &chunk)  
*Loads and runs a chunk of code.*
- bool [OOLUA::load\\_file](#) (lua\_State \*vm, std::string const &filename)  
*Loads a file leaving the resulting function on the stack.*
- bool [OOLUA::run\\_file](#) (lua\_State \*vm, std::string const &filename)  
*Loads and runs the file.*

### 16.8.1 Detailed Description

Provides methods for running and loading chunks.

## 16.9 oolua\_config.h File Reference

**Macros**

- #define [OOLUA\\_USE\\_EXCEPTIONS](#)  
**Default:** Disabled
- #define [OOLUA\\_STORE\\_LAST\\_ERROR](#)  
**Default:** Enabled
- #define [OOLUA\\_RUNTIME\\_CHECKS\\_ENABLED](#)  
**Default:** Enabled

- `#define OOLUA_CHECK_EVERY_USERDATA_IS_CREATED_BY_OOLUA`  
*Default: Enabled*
- `#define OOLUA_USERDATA_OPTIMISATION`  
*Default: Enabled*
- `#define OOLUA_DEBUG_CHECKS`  
*Default: Enabled when `DEBUG` or `_DEBUG` is defined*
- `#define OOLUA_SANDBOX`  
*Default: Disabled*
- `#define OOLUA_STD_STRING_IS_INTEGRAL`  
*Default: Enabled*

### 16.9.1 Detailed Description

Configuration options for the OOLua library.

## 16.10 oolua\_dsl.h File Reference

```
#include "dsl_va_args.h"
#include "proxy_class.h"
#include "proxy_constructor.h"
#include "proxy_member_function.h"
#include "proxy_none_member_function.h"
#include "proxy_public_member.h"
#include "proxy_tags.h"
#include "default_trait_caller.h"
#include "oolua_stack_fwd.h"
#include "oolua_traits.h"
```

### 16.10.1 Detailed Description

Header which provides only what is needed for a class to be proxied using the DSL.

## 16.11 oolua\_dsl\_export.h File Reference

```
#include "proxy_function_exports.h"
#include "oolua_stack.h"
```

### 16.11.1 Detailed Description

Header to be used in conjunction with [oolua\\_dsl.h](#) when exporting proxies using the DSL.

## 16.12 oolua\_error.h File Reference

Generic header to be included when handling errors.

```
#include "oolua_config.h"
#include <string>
```

## Namespaces

- [OOLUA](#)

*This is the root namespace of the Library.*

## Functions

- void [OOLUA::reset\\_error\\_value](#) (lua\_State \*vm)  
*Reset the error state such that a call to [OOLUA::get\\_last\\_error](#) will return an empty string.*
- std::string [OOLUA::get\\_last\\_error](#) (lua\_State \*vm)  
*Returns the last stored error.*

### 16.12.1 Detailed Description

Generic header to be included when handling errors. When the library is compiled with [OOLUA\\_USE\\_EXCEPTIONS == 1](#) it will include the [oolua\\_exception.h](#) header and provide dummy implementations for [OOLUA::get\\_last\\_error](#) and [OOLUA::reset\\_error\\_value](#). When compiled with [OOLUA\\_STORE\\_LAST\\_ERROR == 1](#) it provides implements for [OOLUA::get\\_last\\_error](#) and [OOLUA::reset\\_error\\_value](#).

#### See Also

[Library Configuration](#)

## 16.13 oolua\_exception.h File Reference

```
#include "oolua_config.h"
```

### 16.13.1 Detailed Description

Declares the exceptions which are used by OOLua when [OOLUA\\_USE\\_EXCEPTIONS](#) is set to one.

#### See Also

[Library Configuration](#)  
[Exception classes](#)

## 16.14 oolua\_function.h File Reference

Provides the class [OOLUA::Lua\\_function](#) which is a helper for calling Lua functions.

```
#include "lua_includes.h"  
#include "oolua_stack_fwd.h"  
#include "oolua_ref.h"  
#include "oolua_boilerplate.h"  
#include <string>
```

## Classes

- struct [OOLUA::Lua\\_function](#)  
*Structure which is used to call a Lua function.*

## Namespaces

- [OOLUA](#)

*This is the root namespace of the Library.*

### 16.14.1 Detailed Description

Provides the class [OOLUA::Lua\\_function](#) which is a helper for calling Lua functions.

## 16.15 oolua\_helpers.h File Reference

## Namespaces

- [OOLUA](#)

*This is the root namespace of the Library.*

## Functions

- bool [OOLUA::idxs\\_equal](#) ([lua\\_State](#) \*vm, int idx0, int idx1)
- bool [OOLUA::can\\_xmove](#) ([lua\\_State](#) \*vm0, [lua\\_State](#) \*vm1)

*Uses the Lua C API to check if it is valid to move data between the states.*

## 16.16 oolua\_open.h File Reference

Sets up the a Lua Universe to work with the library.

## Namespaces

- [OOLUA](#)

*This is the root namespace of the Library.*

## Functions

- void [OOLUA::setup\\_user\\_lua\\_state](#) ([lua\\_State](#) \*vm)

*Sets up a [lua\\_State](#) to work with OOLua.*

### 16.16.1 Detailed Description

Sets up the a Lua Universe to work with the library.

## 16.17 oolua\_pull.h File Reference

```
#include "lua_includes.h"
#include "oolua_config.h"
#include "oolua_stack_fwd.h"
#include "oolua_traits_fwd.h"
#include "oolua_string.h"
#include "lvd_types.h"
#include "lvd_type_traits.h"
#include <cassert>
```

### Classes

- class [OOLUA::Proxy\\_class< T >](#)

*A template wrapper for class objects of type T used by the script binding.*

### Namespaces

- [OOLUA](#)

*This is the root namespace of the Library.*

### Functions

- template<typename T >  
bool [OOLUA::pull](#) (lua\_State \*const vm, T &value)  
*Pulls the top element off the stack and pops it.*
- template<typename T >  
bool [OOLUA::pull](#) (lua\_State \*const vm, [OOLUA::cpp\\_acquire\\_ptr< T >](#) &value)  
*Pulls the top element off the stack and pops it.*
- template<typename T >  
bool [OOLUA::pull](#) (lua\_State \*const vm, T \*&value)  
*Pulls the top element off the stack and pops it.*

#### 16.17.1 Detailed Description

Implements the Lua stack operation [OOLUA::pull](#).

## 16.18 oolua\_push.h File Reference

```
#include "lua_includes.h"
#include "oolua_stack_fwd.h"
#include "oolua_traits_fwd.h"
#include "oolua_string.h"
#include "lvd_types.h"
#include "lvd_type_traits.h"
#include <cassert>
```

## Namespaces

- [OOLUA](#)

*This is the root namespace of the Library.*

## Functions

- `template<typename T >`  
`bool OOLUA::push (lua_State *const vm, T const &value)`  
*Pushes an instance to top of the Lua stack.*
- `template<typename T >`  
`bool OOLUA::push (lua_State *const vm, OOLUA::lua_acquire_ptr< T > &value)`  
*Pushes an instance to top of the Lua stack.*
- `template<typename T >`  
`bool OOLUA::push (lua_State *const vm, T *const &value)`  
*Pushes an instance to top of the Lua stack.*

### 16.18.1 Detailed Description

Implements the Lua stack operation [OOLUA::pull](#).

## 16.19 oolua\_registration.h File Reference

```
#include "lua_includes.h"

bool [OOLUA::table\\_at](#) (lua\_State \*vm, int const table\_index, T const &key, T1 &value)  
*The table is at table\_index which can be either absolute or pseudo in the stack table is left at the index.*
- void [OOLUA::new\\_table](#) (lua\_State \*vm, [OOLUA::Table](#) &t)  
*Creates a new valid [OOLUA::Table](#).*
- [OOLUA::Table](#) [OOLUA::new\\_table](#) (lua\_State \*vm)  
*Creates a new valid [Table](#).*

#### 16.24.1 Detailed Description

Wrapper around a table in Lua which allows easy usage.

#### 16.24.2 Macro Definition Documentation

##### 16.24.2.1 #define oolua\_ipairs( table )

Helper for iterating over the sequence part of a table.

## Parameters

|              |  |
|--------------|--|
| <i>table</i> |  |
|--------------|--|

Declares:

- `int _i_index_`  
: Current index into the array
- `int const _oolua_array_index_`  
: Stack index at which table is located
- `lua_State* lvm`  
: The vm associated with the table

## Note

Returning from inside of the loop will not leave the stack clean unless you reset it. usage:

```
oolua_ipairs(table)
{
    if(_i_index_ == 99)
    {
        lua_settop(lvm, _oolua_array_index-1);
        return "red balloons";
    }
}
oolua_ipairs_end()
return "Not enough balloons to go bang."
```

16.24.2.2 `#define oolua_ipairs_end( )`

## See Also

[oolua\\_ipairs](#)

16.24.2.3 `#define oolua_pairs( table )`

Helper for iterating over a table.

## Parameters

|              |  |
|--------------|--|
| <i>table</i> |  |
|--------------|--|

When iterating over a table, for the next iteration to work you must leave the key on the top of the stack. If you need to work with the key, it is a good idea to use `lua_pushvalue` to duplicate it on the stack. This is because if the type is not a string and you retrieve a string from the stack with `lua_tostring`, this will alter the vm's stack entry.

Declares:

- `int const _oolua_table_index_`  
: Stack index at which table is located
- `lua_State* lvm`  
: The vm associated with the table

usage:

```
oolua_pairs(table)
{
    \\do what ever
    lua_pop(vm); \\Pop the value, leaving the key at the top of stack
}
oolua_pairs_end()
```

16.24.2.4 `#define oolua_pairs_end( )`

### 16.25.1 Detailed Description

Forward declarations of [Traits](#)

## 16.26 oolua\_version.h File Reference

OOLua library version information for both the CPP and at run time.

## Namespaces

- [OOLUA](#)

*This is the root namespace of the Library.*

## Macros

- `#define OOLUA_VERSION_MAJ 2`  
*CPP major version number.*
- `#define OOLUA_VERSION_MIN 0`  
*CPP minor version number.*
- `#define OOLUA_VERSION_PATCH 0`  
*CPP patch version number.*
- `#define OOLUA_VERSION`  
*CPP string detailing the library version.*

## Variables

- static const char `OOLUA::version_str []` = `OOLUA_STRINGISE(OOLUA_VERSION_MAJ) "." OOLUA_STRINGISE(OOLUA_VERSION_MIN) "." OOLUA_STRINGISE(OOLUA_VERSION_PATCH) " Beta 3"`  
*OOLua version string.*
- static const int `OOLUA::version_number` = `2*10000+0*1000+0`  
*OOLua version int.*

### 16.26.1 Detailed Description

OOLua library version information for both the CPP and at run time.

## 16.27 platform\_check.h File Reference

### 16.27.1 Detailed Description

Performs a check of platform defines and defines a macro

#### Remarks

Information available via <http://predef.sourceforge.net/preos.html>

## 16.28 proxy\_base\_checker.h File Reference

Checks the heirachcal bases to ensure a cast is defined.

```
#include "type_list.h"
#include "proxy_userdata.h"
#include "proxy_class.h"
```

## Namespaces

- [OOLUA](#)

*This is the root namespace of the Library.*

### 16.28.1 Detailed Description

Checks the heirachcal bases to ensure a cast is defined. Walks a list of bases class defined in a [OOLUA::Proxy\\_](#) class to find if a type can be converted to the requested type, if it is valid then the procdcures will preform the cast.

## 16.29 proxy\_caller.h File Reference

Provides implementations which actually call the member or stand alone function, it also pushes a function return to the stack if the fubction has one.

```
#include "oolua_boilerplate.h"
#include "oolua_traits_fwd.h"
#include "type_converters.h"
#include "proxy_stack_helper.h"
#include "lua_includes.h"
#include "oolua_config.h"
```

### 16.29.1 Detailed Description

Provides implementations which actually call the member or stand alone function, it also pushes a function return to the stack if the fubction has one.

## 16.30 proxy\_class.h File Reference

```
#include "type_list.h"
```

### Classes

- class [OOLUA::Proxy\\_class< T >](#)

*A template wrapper for class objects of type T used by the script binding.*

### Namespaces

- [OOLUA](#)

*This is the root namespace of the Library.*

### Macros

- #define [OOLUA\\_PROXY\\_END](#)

*Ends the generation of the proxy class.*

- #define [OOLUA\\_ENUM](#)(EnumName)

*Creates a entry into a [OOLUA\\_ENUMS](#) block.*

- #define [OOLUA\\_ENUMS](#)(EnumEntriesList)

*Creates a block into which enumerators can be defined with [OOLUA\\_ENUM](#).*

### 16.30.1 Detailed Description

Defines the class, its bases in the hierarchical tree. The classes name an array used to hold the functions its make available to the script and C++ special member functions

## 16.31 proxy\_constructor.h File Reference

```
#include "lua_includes.h"
#include "oolua_traits_fwd.h"
#include "proxy_tags.h"
#include "proxy_storage.h"
#include "proxy_tag_info.h"
#include "proxy_userdata.h"
#include "proxy_stack_helper.h"
#include "proxy_constructor_param_tester.h"
#include "type_converters.h"
#include "oolua_boilerplate.h"
```

### Macros

- `#define OOLUA_CTOR(...)`  
*Generates a constructor in a constructor block.*
- `#define OOLUA_CTORS(ConstructorEntriesList)`  
*Creates a block into which none default constructors can be defined with [OOLUA\\_CTOR](#).*

## 16.32 proxy\_constructor\_param\_tester.h File Reference

Helps test that a constructor parameter is of the requested type so that a matching constructor can be called.

```
#include "proxy_userdata.h"
#include "lua_includes.h"
#include "class_from_stack.h"
#include "oolua_config.h"
#include "type_list.h"
#include "oolua_string.h"
#include "oolua_traits_fwd.h"
```

### Namespaces

- [OOLUA](#)  
*This is the root namespace of the Library.*

### 16.32.1 Detailed Description

Helps test that a constructor parameter is of the requested type so that a matching constructor can be called.

## 16.33 proxy\_function\_dispatch.h File Reference

```
#include "lua_includes.h"
#include "proxy_class.h"
#include "class_from_stack.h"
#include "oolua_config.h"
```

## 16.34 proxy\_function\_exports.h File Reference

### Macros

- `#define OOLUA_EXPORT_NO_FUNCTIONS(Class)`

*Inform that there are no functions of interest.*

### 16.34.1 Detailed Description

#### Date

Wed Oct 23 17:57:13 2013

Configurable values as set when generating this file

- `class_functions` 15 - Maximum amount of class functions that can be registered for each proxied type (Default 15)

#### Note

Warning this file was generated, edits to the file will not persist if it is regenerated.

## 16.35 proxy\_member\_function.h File Reference

Internal macros which generate proxy member functions.

```
#include "oolua_traits_fwd.h"
#include "oolua_boilerplate.h"
#include "proxy_caller.h"
#include "default_trait_caller.h"
#include <cassert>
#include "oolua_config.h"
```

### 16.35.1 Detailed Description

Internal macros which generate proxy member functions.

## 16.36 proxy\_none\_member\_function.h File Reference

Contains internal macros for proxying none member functions.

```
#include "oolua_traits_fwd.h"
#include "oolua_boilerplate.h"
#include "proxy_caller.h"
#include "default_trait_caller.h"
#include "oolua_config.h"
```

### 16.36.1 Detailed Description

Contains internal macros for proxying none member functions.

## 16.37 proxy\_operators.h File Reference

```
#include "lua_includes.h"
#include "proxy_userdata.h"
#include "proxy_storage.h"
#include "oolua_stack_fwd.h"
#include "oolua_traits_fwd.h"
#include "push_pointer_internal.h"
#include "type_list.h"
```

### Namespaces

- [OOLUA](#)

*This is the root namespace of the Library.*

### 16.37.1 Detailed Description

Defines operators which will be made available in scripts when a [OOLUA::Proxy\\_class](#) contains [operator tags](#)

## 16.38 proxy\_public\_member.h File Reference

Proxies a class public member variable.

```
#include "oolua_stack_fwd.h"
#include "proxy_test.h"
#include "lvd_type_traits.h"
```

### 16.38.1 Detailed Description

Proxies a class public member variable.

## 16.39 proxy\_stack\_helper.h File Reference

```
#include "lua_includes.h"
#include "oolua_stack_fwd.h"
#include "oolua_string.h"
#include <cassert>
#include "push_pointer_internal.h"
```

### Namespaces
